Introduction

Important

To the maximum extent permitted by applicable laws, in no event will the manufacturer be liable for any damages whatsoever arising out of failures of this product, losses of documents or data, or the use or non-use of this product and operation manuals provided with it.

Make sure that you always copy or have backups of important documents or data. Documents or data might be erased due to your operational errors or malfunctions of the software. Also, you are responsible for taking protective measures against computer viruses, worms, and other harmful software.

In no event will the manufacturer be responsible for any documents created by you using this product or any results from the data executed by you.

Cautions regarding this guide

- Some illustrations or explanations in this guide could differ from your product due to improvement or change in the product.
- The contents of this document are subject to change without notice.
- No part of this document may be duplicated, replicated, reproduced in any form, modified, or quoted without prior consent of the supplier.
- Throughout this publication, references to directory paths indicate the default paths only. If you install InfoPrint Manager or any of its components in a different location, including a different drive, you must adjust the paths accordingly.
For example, if you install InfoPrint Manager on the D: drive of a computer running a Windows operating system, replace C: with D: in the directory paths.

Guides for this application

This publication provides information about RICOH InfoPrint Manager™ for AIX, Linux, and Windows, Version 4.13 (Program Number 5648-F40).

This publication includes an overview of InfoPrint Manager and installation and configuration information about the product.

Instruction manuals

These instruction manuals are included:

For information about InfoPrint Manager, see these documents:

Help

Property help is available on many screens to provide information for specific tasks and settings.

In addition, the **Help** menu provides access to the HTML version of the instruction manual directly from the user interface.

↓ Note

- A PDF reader, such as Adobe Reader, must be installed to view the PDF documentation.

For more information about RICOH printing products, see:

RICOH Commercial and Industrial Printing website at <https://www.ricoh-usa.com/en/products/commercial-industrial-printing>.

RICOH Software Information Center at <https://help.ricohsoftware.com/swinfocenter>.

How to read the documentation

Displaying the instruction manual

Use this procedure to view the instruction manuals.

Displaying the instruction manual in PDF format

- InfoPrint Manager includes publications in PDF format on the DVD-ROM supplied with the product.

Displaying the instruction manual in HTML format

- The HTML version of the instruction manual is available directly from the user interface. Start the application, and then click  button at the right of the banner and select **Help**.

Displaying property help

Click the  button next to a property on the user interface to display the property help for that item.

Symbols

The following symbols are used in this manual to help you to identify content quickly.

Important

- This symbol indicates points to pay attention to when using the product. Be sure to read these explanations.

Note

- This symbol indicates helpful supplementary information that is not essential to completing a task.

Bold

Bold type indicates the names of dialogs, menus, menu items, settings, field labels, buttons, and keys.

Italic

Italic type indicates the titles of manuals and variables that you must replace with your own information.

Monospace

Monospace type indicates computer input and output.

1. What Is PPFA?

• Introducing Page Printer Formatting Aid

Introducing Page Printer Formatting Aid

Page Printer Formatting Aid is a program that enables users of Advanced Function Presentation (AFP) products to create their own formatting resources, called form definitions and page definitions. The form definitions and page definitions are stored in libraries as AFP resources. (For the purposes of this book, the term “library” includes Windows directories and VM files.) Using AFP resources requires IBM Print Services Facility (PSF), AFP Conversion and Indexing Facility (ACIF), or InfoPrint Manager licensed programs or features, which merge resources with user data files. This merging creates a data stream for printing or viewing.

Using a form definition or a page definition created by PPFA requires you to perform three steps:

1. Write a set of PPFA commands that define how to position the data or handle the physical sheets.
2. Run PPFA to build the specified page definition or form definition and store the output as resources in a library.
3. Submit the print file using your print server, specifying the page definition and form definition needed to accomplish the desired results.

↓ Note

Not all functions provided by PPFA are supported in all printers and printer server licensed programs. Refer to the information for the printer and printer server licensed program that you are using to determine which functions are supported.

Summary of a Form Definition

A PPFA command stream can contain form-definition commands. A *form definition* specifies how the printer controls the processing of the physical sheets of paper. In a form definition, you can specify modifications that distinguish formatting one print job from another when both are derived from the same data. Form definitions are used for all print server print files regardless of data type.

Form definitions can specify the following functions:

- Position of a logical page on a physical page
- Duplex printing
- Inclusion of overlays, which substitute for preprinted forms
- Flash (the use of a forms flash, on 3800 printers only)
- Selection of the number of copies for any page of data
- Suppression (the exclusion of selected fields of data in one printed version of a page of data but not in another)
- Jog (the offset stacking of cut-sheet output or copy marking on continuous-forms output)
- Selection among paper sources in a cut-sheet printer
- Adjustment of the horizontal position of the print area on the sheet (only on 3800 printers)
- Quality (selection among print quality levels)

- Constant (allows front or back printing of a page without variable data)
- Printing one, two, three, or four logical pages on a single side of a page
- Postprocessing controls, such as:
 - Selecting device-dependent functions defined by the postprocessing device
- Finishing operations:
 - Center Fold In
 - Corner Staple
 - Edge Staple
 - Saddle Stitch (In and Out)
 - Separation Cut
 - Perforation Cut
 - Fold
 - Z-Fold
 - Punch
 - UP3i Finishing

Summary of a Page Definition

A *page definition* specifies how you want data positioned on the logical page. A page definition can control the following functions:

- Dimensions of the logical page
- Print direction of the logical page
- Print direction of text lines and fields relative to the logical page
- Conditional processing (different formats on different pages, based on content of data)
- Text line spacing (number of lines per inch)
- Location of individual text lines and fields
- Number of text lines per page
- Page segments for inclusion in printed output
- Overlays for inclusion in printed output (positioned anywhere on the page)
- Page-ejection points
- Fonts and font rotation used on a page
- Multiple-up printing (placing more than one subpage on one side of a single sheet)
- Colors to be used (on printers that support this function)
- One and two dimensional barcodes (on printers that support this function)
- External objects for inclusion in printed output (can be positioned anywhere on the page)
- Preloading and Preripping of external objects and overlays

Formatting Output of Different Data File Types

The basic types of data printed on the print server printers are:

- Line-data files, p. 13
- Traditional line data, p. 14
- Record format line data, p. 14
- Mixed-data files, p. 14
- MO:DCA-P data files, p. 14
- Unformatted ASCII files, p. 15 (typically Windows)
- XML data

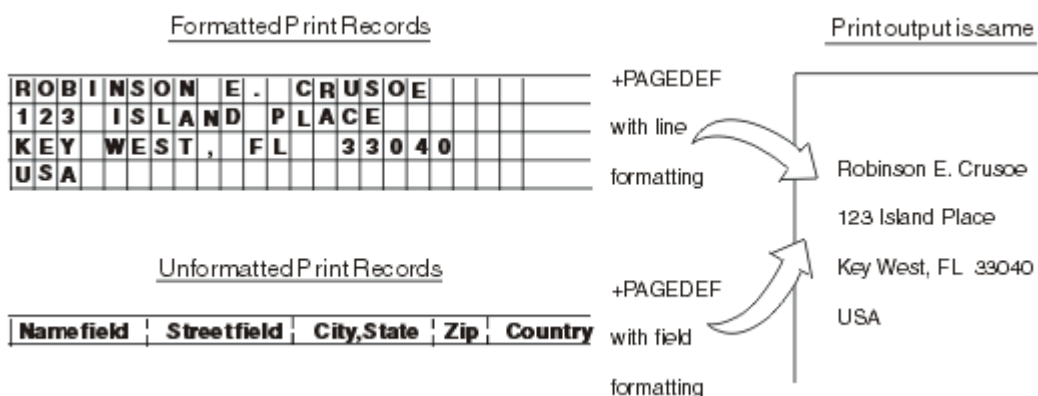

Line-data files, mixed-data files, and unformatted ASCII require a [page definition, p. 12](#) and a [form definition, p. 11](#). MO:DCA-P data files require only a form definition.

Line-Data Files

Line data is EBCDIC data that is arranged for printing on line printers. These records may contain line-printer control characters such as carriage control characters (CC), [table-reference characters, p. 20](#) (TRC), or only data. To compose pages for the page printer from line data, the print servers separates the incoming print records into pages according to specifications in a page definition. A page definition is always required for printing line data with the print server. You can create your own page definition or use a page definition provided with the print server. There are two types of line data: traditional and record format.

The following figure shows two types of line data. The first type shows data arranged as it prints out and the second shows data that requires field processing.

Formatted and Unformatted Print Records

The technique of mapping the unformatted data to locations on the output pages is known as field processing or record processing and is available through use of page-definition controls. Field processing is explained in detail in [Processing Fields, p. 50](#).

Traditional Line Data

Traditional line data is data formatted for printing on a line printer. Fully formatted line data can be printed on a line printer without a page definition, however all line data needs a page definition to be printed on a page printer.

A traditional line data record can contain a 1-byte carriage control character and a 1-byte table reference character followed by the data to be printed. (With a line printer, the maximum number of data bytes in a single input record is 208. With a page printer, the maximum number is 32,768 bytes). Refer to [Using Page Definition Commands for Traditional Line Data, p. 39](#) for additional information on using traditional line data.

Record Format Line Data

The *record formatting function* allows an application to specify a format identifier (record id) with each set of data fields (data record). The format identifier references a specific layout format in a Page Definition (PAGEDEF). At print time, each layout format (referenced by a record ID in a data record) is retrieved from the PAGEDEF and used to position and format the associated data records/fields on the output page. The PAGEDEF can contain any number of layout formats. The application can use a PAGEDEF layout format to either insert an end of page when a specified last line point is exceeded on the output page or to force an end of page. Refer to [Using Page Definition Commands for Record Format Line Data and XML Data, p. 61](#) on using record format line data.

Example of Record Format Line Data

statmid	Justin Case	123 Sligo Lane	Longmont	CO 80501
ckheader				
ckdata	352	01/04/07	\$ 321.50	Blind Squirrel Golf
ckdata	353	01/05/07	\$ 100.00	Janie's Pancake Spot
ckdata	354	01/10/07	\$ 122.30	History Bookstore
ckdata	355	01/11/07	\$ 59.95	Kristina's Pretty Things
ckdata	356	01/15/07	\$ 852.33	Pirie Racing Enterprises
ckdata	357	01/30/07	\$ 500.35	Skippy's Music Center
Ckend				

Mixed-Data Files

Mixed-data files consist of MO:DCA-P data and line data or unformatted ASCII data. Such files may or may not specify the beginning and ending of pages and may or may not contain page addresses and data controls for page printing. The line-data portion of such files must be formatted for page printers by page-definition controls.

MO:DCA-P Data Files

MO:DCA-P data files are formed into pages before the print server receives them. These files already contain the imbedded controls for printing on page printers. They contain such things as page addresses and data controls for page printing functions.

Note

Refer to *Mixed Object Document Content Architecture Reference* and *Advanced Function Presentation Programming Guide and Line Data Reference* for more information about MO:DCA-P data. User application programs can also generate MO:DCA-P data.

Unformatted ASCII Files

Unformatted ASCII files consist of ASCII data with no formatting controls (escape sequences) in the data.

The technique of mapping the unformatted ASCII data to locations on the output pages is known as field processing or record processing and is available through use of page-definition controls. Field processing is explained in detail in [Processing Fields, p. 50](#).

Unformatted ASCII data differs from unformatted EBCDIC data in that ASCII data is what is generally created on a personal computer or workstation, while EBCDIC data is what is generally created on a mainframe host, such as z/OS.

PPFA Concepts

The concepts of [physical page, p. 15](#), [logical page, p. 15](#), and [subpage, p. 15](#) are basic to understanding form-definition and page-definition controls.

Physical Page

A *physical page* is the sheet of paper or other medium (a sheet of labels, for instance) that moves through the printer.

Logical Page

A *logical page* is the area you define in a PPFA command stream as the space on the physical page where data is printed. The logical page is positioned in relation to the *media origin*. For more information about the media origin of your printer, refer to your printer documentation. The positioning of the logical page on the sheet of paper is described in [Positioning a Logical Page on a Sheet, p. 27](#).

An N_UP command enables you to place one, two, three, or four logical pages on a single sheet. This is in contrast to multiple-up printing, which enables you to place subpages on one logical page.

Subpage

A *subpage* is a part of a logical page on which line data may be placed. Subpages are used only with conditional processing. Multiple-up printing can be done with or without subpages being defined. In the page definition, multiple subpages can be placed on the physical page based on changes in the print data. A good example of this is the use of *multiple-up* printing, which is printing two or four pages on a single side of a sheet. For more information, see [Subpage Description and Processing, p. 124](#).

PPFA Basic Terms

The following terms have meanings that are special to PPFA:

- [Printline](#), p. 16
- [Layout](#), p. 16
- [Direction](#), p. 16
- [Rotation](#), p. 18
- [Presentation](#), p. 18
- [N_UP partitions](#), p. 18
- [Modifications](#), p. 19

Printline

Printline is a single line of text, and is the traditional command that is synonymous with the record formatting *Layout* command. In the formatting of line data and unformatted ASCII, a printline is normally the output generated by one record in the print file. However, printlines and print records are not the same.

PRINTLINE commands in the PPFA page definition define the number and position of printlines on a page. Each record in the print file is written to a single printline on a page. Usually, one print record is written to each printline. However, control information in the print data can specify two or more print records be written to the same printline, providing overprinting. Controls also can specify that print records skip printlines. For example, a print record may skip the remaining printlines on a page and print instead on the first printline of a new page.

Layout

Layout specifies a single line of text, and is the record formatting command that is synonymous with the traditional *Printline* command. In the formatting of line data and unformatted ASCII, a layout is normally the output generated by one record in the print file. However, layouts and print records are not the same.

LAYOUT commands in the PPFA page definition define the number and position of layouts on a page. Each record in the print file is written to a single layout on a page. Usually, one print record is written to each layout. However, control information in the print data can specify two or more print records be written to the same layout, providing overprinting. Controls also can specify that print records skip layouts. For example, a print record may skip the remaining layouts on a page and print instead on the first layout of a new page.

Direction

Text can be printed in four print directions. A print direction is a combination of both inline and baseline directions. For each of the directions, characters can be printed in four rotations.

The line direction is the direction in which successive characters are added to a line of text. The four line directions are:

ACROSS

Text characters are placed in a line from left to right across the page.

DOWN

Text characters are placed in a line from top to bottom down the page.

BACK

Text characters are placed in a line from right to left across the page.

UP

Text characters are placed in a line from bottom to top up the page.

The baseline direction is the direction in which successive lines of text are added to a page. The four character rotations, measured clockwise around each inline direction, for each line direction are:

- 0°
- 90°
- 180°
- 270°

For example, the text in this paragraph is printed **ACROSS** the page, and its rotation is 0°.

The next figure shows the four possible directions. For information about the combinations supported by the printer you are using, refer to your printer documentation.

Baseline Direction and Inline Direction**Across****Down****Back****Up**

Rotation

Individual characters can be *rotated*. Character rotation can be 0°, 90°, 180°, or 270° relative to the inline direction of the printline or field.

Note

On the 3800 printers only, character rotation differs between *bounded-box fonts* and *unbounded-box fonts*. Bounded-box fonts rotate the fonts; unbounded-box fonts are rotated by selecting the correct font.

Presentation

Presentation describes the shape of the page as it is viewed by the reader. The next figure shows an example of how text is presented (positioned) on the page. There are two page presentations: *portrait* and *landscape*.

Portrait

Is designed to be viewed with the short side at the top of the page.

Landscape

Is designed to be viewed with the long side at the top of the page.

Portrait and Landscape Presentations

Document A- Portrait Presentation

Document B- Landscape Presentation

N_UP Partitions

Some printers allow the physical sheet of paper to be divided into equal-sized partitions. For two or three partitions, each sheet is divided along one or two lines equally spaced along the longer side of the sheet. The printer positions a logical page of print data in each partition. This enables printing multiple logical pages with different formats and modifications on a single sheet of paper.

The size and arrangement of the partitions on the sheet depends on the number of partitions and the shape and size of the paper. For two or three partitions, each sheet is divided at two or three points

equally spaced along the longer side of the sheet. For four partitions, each sheet is equally divided both vertically and horizontally. See [N_UP Printing, p. 143](#) for more information.

Modifications

Modifications are sets of form definition controls that apply to one page of a data file. With these controls, you can:

- Define the type of duplex printing to be done
- Define one, two, three, or four partitions for N_UP
- Select an overlay
- Suppress the appearance of a field
- Select the forms flash option (for the 3800 printer only)
- Specify the number of copies for a set of modifications
- Specify post-printing processing options

You can specify different sets of modifications for the same page of data in one form definition, and therefore in one print job, by a series of [SUBGROUP, p. 265](#) commands. For example, a form definition with two **SUBGROUP** commands is said to have two sets of modifications. The same page of data is printed for each set of modifications, resulting in a slightly different output for each printing.

Definitions of Command, Subcommand, and Parameter

[Commands, p. 19](#), [subcommands, p. 19](#), and [parameters, p. 19](#) are terms used throughout this publication to refer to the contents of PPFa control statements. [Form Definition Command Reference, p. 208](#) and [Page Definition Command Reference, p. 269](#) describe these commands with all their applicable subcommands.

Commands

Commands are the major controls composing form definitions and page definitions.

Subcommands

Subcommands are used to further define commands. The absence of subcommands means that the default values specified with those subcommands are used. Three command terms also appear as subcommand terms: **FONT**, **OVERLAY**, and **SUPPRESSION**. These subcommand terms further define other commands.

Parameters

You can specify *parameters* with subcommands or accept the defaults. Valid entries and their defaults are shown in the command reference chapters.

Basic Controls in Traditional Line Data

The following line-printer controls may be included in a line data or unformatted ASCII file and can be used by a page definition to enable AFP functions:

- Carriage control characters
- Table-reference characters
- Record IDs

Carriage Control Characters (CC)

Carriage control characters, which control line skipping, line spacing, and page ejection on line printers, are fields within line-data and unformatted-ASCII records. They are compatible with page printers when page definitions format the printed data. In page definitions, you can specify **CHANNEL** subcommands that correspond to carriage control characters corresponding to channels 1 through 12 in the data. When you do so, the carriage control characters operate just as they do in a line-printer environment.

 **Note**

ASCII ANSI, ANSI, and EBCDIC (machine) handle carriage control characters differently. See the **SPACE_THEN_PRINT** subcommand listed in [Subcommands \(Long Form\)](#), p. 273 for more information.

Table-Reference Characters (TRC)

Table-reference characters (TRCs) control font selection in line-data and unformatted-ASCII output. Page definitions can be used to map table-reference characters to AFP fonts for use with page printers.

For more information about table-reference characters, see the *Advanced Function Presentation: Programming Guide and Line Data Reference*, S544-3884.

Record ID

Record IDs are used only with the record formatting function.

Basic Controls in Record Format Line Data

Record format line data is a new form of line data that is supported by the print server and formatted by a page definition. With this format, each data record contains a 10-byte record identifier that selects the record descriptor (RCD) in a record format page definition used to format the line data. This RCD might contain a carriage control (CC) byte.

Carriage Control Characters (CC)

The CC byte is required when record format data is mixed with MO:DCA-P data, but is ignored. The CC byte is optional for record format line data at all other times, however if you enter it, you must inform the print server that it is there.

Many functions used in the line descriptor (LND) to format traditional line data are used in RCD to format record format line data. Others, such as header and trailer processing, are unique to RCDs.

Traditional line data is similar to record format line data in that neither is formatted into pages. However, traditional line data can be printed on line printers while record format line data cannot. For more information, refer to [Using Page Definition Commands for Record Format Line Data and XML Data](#), p. 61.

Note

ASCII ANSI, ANSI, and EBCDIC (machine) handle carriage control characters differently. See the **SPACE_THEN_PRINT** subcommand listed in [Subcommands \(Long Form\)](#), p. 273 for more information.

Table-Reference Characters (TRC)

Table-reference characters (TRCs) cannot be used in record formatted line data.

Record ID

Record IDs are only used with the record formatting function. They reside in the first 10 characters of each line data record, and control the layout type that is selected for each given record. These 10 characters are reserved for record IDs and are not included as part of a defined field or conditional area.

Structured Fields in Line Data

Note

Structured fields are not supported with XML data.

To make use of the full function of page definitions and form definitions, MO:DCA-P structured fields may be required in the users data. The following MO:DCA-P structured fields can be included in a line-data to activate AFP functions:

- [Invoke Data Map](#), p. 22
- [Invoke Medium Map](#), p. 22
- [Include Page Segment](#), p. 22
- [Include Page Overlay](#), p. 22
- [Include Object](#), p. 22
- [Include Presentation Text \(PTX\)](#), p. 22
- [No Operation \(NOP\)](#), p. 22

Note

For information about mixed mode, see the *Advanced Function Presentation: Programming Guide and Line Data Reference*, S544-3884.

1

Invoke Data Map

Add the Invoke Data Map structured field to the line-data or unformatted ASCII file at a point that requires switching from one page format to another. The term “data map” is the name used for the term “page format” in PSF publications and PSF terminology.

Invoke Medium Map

Add the Invoke Medium Map structured field to the line-data or unformatted-ASCII file at a point that requires switching from one copy group to another. The term “medium map” is the name used for the term “copy group” in PSF publications and PSF terminology.

Include Page Segment

Position the Include Page Segment structured field within the line or unformatted ASCII data for placing the page segment on the page.

Include Page Overlay

Position the Include Page Overlay structured field within the line or unformatted ASCII data for placing the overlay anywhere on the page.

Include Object

Position the Include Object structured field for placing an object containing other object types (for example, IOCA or BCOCA) for placing the object anywhere on the page.

Presentation Text

A presentation text object can be included in line data using the Presentation Text (PTX) structured field, which is a self-contained object consisting of line spacing, page margin, data position and font settings. Refer to the *AFP Programming Guide and Line Data Manual*, S544-3864 and the *Presentation Text Object Content Architecture Reference*, SC31-6803 for additional information.

No Operation

A No Operation (NOP) structured field can be placed in the line data stream. This can be used to insert information, such as a comment, into the data stream.

Normal Duplex and Tumble Duplex

Some page printers can print on both sides of a sheet, which is called *duplex* printing. Duplex printing can be done in four ways:

- Normal duplex
- Tumble duplex
- Rotated normal duplex
- Rotated tumble duplex

In normal duplex, both sides have the same orientation, as in most books. In tumble duplex, the back of each page is upside down with respect to the front of the page: the top of one side of the sheet is at the same edge as the bottom of the other side. These two types of duplex allow you to specify top binding or side binding of the printed pages.

Duplex also involves the commands **RNORMAL** (rotated normal) and **RTUMBLE** (rotated tumble), which are used with landscape-presentation pages to specify the type of duplex printing. See figure [DUPLEX NORMAL: Portrait and Landscape Presentation, p. 35](#) and [Result When Either TUMBLE or RNORMAL Is Specified, p. 36](#) for illustrations of duplex printing.

2. Examples of Using PPFA

- Using Form Definition Commands
- Using Page Definition Commands for Traditional Line Data
- Using Page Definition Commands for Record Format Line Data and XML Data
- Creating Complex Printouts
- Conditional Processing
- N_UP Printing
- AFP Color Management

Using Form Definition Commands

A form definition is a resource, used by the print server, that specifies how the printer controls the processing of the sheets of paper. With form definitions, you can perform the tasks listed in the next table.

Form Definition Tasks

Tasks	Location of Example
Creating a form definition	Commands Required to Create a Form Definition, p. 26
Positioning a logical page	Positioning a Logical Page on a Sheet, p. 27
Specifying landscape presentation	OFFSET Subcommand with Rotated Print Direction, p. 28
Specifying copies and electronic overlays	Specifying Copies and Electronic Overlays, p. 29
Printing constant forms	Printing Constant Forms, p. 30
Duplex printing in two orientations	Duplex Printing, p. 31
Printing portrait and landscape	Duplex Printing in Portrait and Landscape Presentations, p. 33
Specifying the page presentation on continuous-forms printers	Specifying Page Presentation on Continuous-Forms Printers, p. 36

Copy Groups and Subgroups

A single form definition can contain several subsets of page controls, called *copy groups*. Copy groups define each physical page in the file. When you are printing jobs in duplex, the copy group defines both sides of the physical paper. Copy groups, in turn, can contain up to 127 *subgroups*, each of which creates a different set of modifications for the same page of data.

A series of copy groups can be used where either the data or the printing requirements call for a variety of page control schemes. Part of the file can be printed from one (bin) paper source and part from another. Part can be printed duplex; part can be printed simplex. Duplex commands can be specified for a printer that does not support this function. This command treats the two adjacent pages as duplexed. A variety of controls can be contained in one form definition having several copy groups.

You can control the following options within a copy group:

- Position of the logical page on a sheet of paper
- Duplex printing
- Type of cut-sheet paper to be printed on (by choosing between paper input sources in page printers that have more than one paper source)
- Offset stacking or copy marking of parts of a print job in the output stacker
- Printing one, two, three, or four logical pages on a single side of a sheet
- Vendor-attached devices for post-processing functions to be performed on the sheet
- Print-quality level

To access a new copy group within a form definition you can:

- Add to your data file an Invoke Medium Map structured field immediately before the page of data that requires the new copy group.
- Use a page definition that specifies conditional processing. When you access a new copy group, printing begins on the next physical sheet of paper.

For more information on the Invoke Medium Map structured field, refer to *Mixed Object Document Content Architecture Reference*.

Subgroups allow the same page of data within a file to be printed more than once, using different sets of modifications each time the page is printed. One example is the printing of an invoice and a packing list from the same records in a data file.

The following modifications to the page of data can be specified in a subgroup:

- Selection of suppressed fields for the page
- Selection of overlays used with the page
- Selection of forms flash with the page (only on the 3800 printer)
- Selection of the modification for front, back, or both sides of a sheet
- Selection of the number of copies of the subgroup to print
- Selection of the input bin

Commands Required to Create a Form Definition

The following simplified command stream shows the proper nesting of commands and the sequence in which the commands must be entered when you are creating a form definition:

```
[SETUNITS ]
FORMDEF
[SUPPRESSION ...]
[COPYGROUP ]
  [OVERLAY ...]
  [SUBGROUP ...]
[COPYGROUP ]
  [OVERLAY ...]
  [SUBGROUP ...]
```

↓ Note

1. If the form definition has only one copy group, the **COPYGROUP** command can be omitted. The **OVERLAY** command then follows any **SUPPRESSION** command.
2. Indentations are used to improve readability.
3. Complete definitions of commands are in [Form Definition Command Reference, p. 208](#).

Command Nesting Rules

1. **SUPPRESSION** commands must be specified immediately after **FORMDEF** commands.
2. **SUBGROUP** commands are specified under their associated **COPYGROUP** command or under the **FORMDEF** command.
3. **OVERLAY** commands are specified immediately after **COPYGROUP** commands.
4. The first **COPYGROUP** command can be omitted in a form definition if the form definition has only one copy group, and if it contains no **OVERLAY** commands.
5. A **SETUNITS** command can be placed anywhere in the PPFA command stream and is in effect until another **SETUNITS** command is encountered.
6. More than one of each command can appear under one form definition.
7. If an **OVERLAY** occurs outside of a **COPYGROUP** (immediately after the **FORMDEF**), PPFA generates a **COPYGROUP** with the **FORMDEF** name. This becomes the first **COPYGROUP** and may not be the desired effect. If this occurs, PPFA issues a warning message .

Positioning a Logical Page on a Sheet

The example in this section shows how the **OFFSET** subcommand is used to position the logical page on the physical sheet. A logical page is the area on a sheet of paper where all printing occurs. You establish the *logical page origin*, the point nearest the media origin, with the **OFFSET** subcommand. The **OFFSET** subcommand requires two coordinates and may have four. The first *x* and *y* coordinate defines the position on the front of the sheet, and the second *x* and *y* coordinate defines the position on the back of the sheet. A sample form definition that specifies the logical page position for a simplex sheet is:

```
FORMDEF ABCD
      OFFSET 1 IN 1 IN ;
```

↓ Note

The 1 IN 1 IN is an abbreviation for 1 INCH 1 INCH. PPFA supports a number of different units of measurement formats. See [Units of Measurement, p. 207](#) for all the different formats.

The example places the logical page origin one inch to the right of and one inch down from the media origin.

The next figure shows the meaning of the *x* and *y* coordinates. In writing an **OFFSET** subcommand, the first parameter specifies *x*; the second parameter specifies *y*. If the *x* and *y* are repeated for the offset of the back side of the physical page, the same applies. The *x* defines the horizontal offset; the *y* defines the vertical offset. In this example, the logical page direction is **ACROSS**. The arrows within the logical

page indicate the inline direction for text on the page. The lines of text are added according to the baseline direction.

Origin of Logical Page

The next figure shows the meaning of x and y in a logical page specification for a 3900 sheet. The 3900 sheet does not have an unprintable area, but **FORMDEFs** supplied with the print server have a $1/6$ inch offset.

Origin of a Logical Page on a 3900 Sheet

OFFSET Subcommand with Rotated Print Direction

The next figure shows that the media origins and logical page origins do not change when the print direction of the page changes, although the way you view the page does change. The arrows within the logical page show the **DOWN** print direction—producing landscape page presentation.

Be careful to coordinate form definitions and page definitions when you change between portrait and landscape presentations.

The Meaning of OFFSET Parameters within a Landscape Page

Specifying Copies and Electronic Overlays

This example shows how to specify different electronic overlays in different subgroups. The electronic overlays you specify are created separately, using a program such as IBM Overlay Generation Language/370, and are stored as resources in the overlay library. No positioning controls are needed in the form definition with an overlay; the overlays are merely named. The overlay contains its own positioning data relative to the physical sheet. A form definition containing two overlays might look like this:

```
FORMDEF SLSCOM ;
COPYGROUP SLSCOM ;
  OVERLAY SLSRPT M1001 ; /*LOCAL NAME AND USER-ACCESS NAME*/
  OVERLAY M1002 ; /*USER-ACCESS NAME ONLY */
SUBGROUP COPIES 2
  OVERLAY SLSRPT ;
SUBGROUP COPIES 3
  OVERLAY M1002 ;
```

The steps to write this form definition are:

1. Create a copy group.
 - 1) Write a **COPYGROUP** command.
 - 2) Write an **OVERLAY** command for each overlay.
2. Create two subgroups by writing two **SUBGROUP** commands. Each subgroup contains an **OVERLAY** subcommand naming one of the selected overlays.

Note

The overlays must be named in each copy group.

Overlay Names

To identify overlays by name, you must be aware of the three possible names for an overlay: a local name (SLSRPT) and two system names (M1001, O1M1001). The *local name* is used only within the

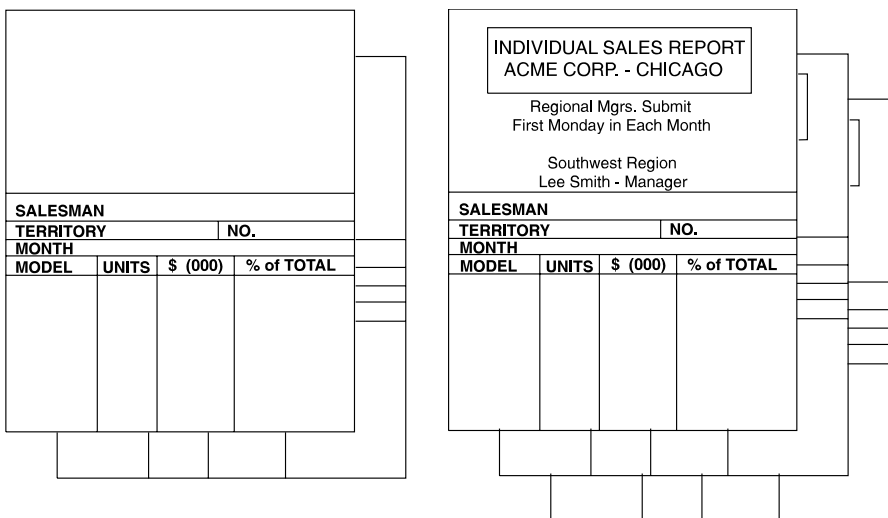

PPFA command stream; its use is optional. An example of this is SLSRPT in the first **OVERLAY** command of the previous sample command stream.

The *system name* identifies an overlay in the library. It has two forms: the *user-access name* (M1001 in the sample set of commands) and the *library-resource name*. Of these, you use only the user-access name. PPFA automatically adds the O1 overlay prefix to the user-access name, which identifies the resource in the library. An overlay referenced through a form definition built with PPFA, therefore, must begin with the O1 prefix. An example of the result is O1M1001, the library-resource name.

You can make up your own local name for an overlay. However, the local name must be used in the **OVERLAY** subcommand in the subgroup if it is used in an **OVERLAY** command for the copy group. If it is not, the subgroup must specify the user-access name, as has been done for overlay M1002 in the example.

This example, specifying copies and electronic overlays, also specifies the number of copies of each subgroup. More than one copy of printed output can be requested by placing the **COPIES** subcommand and the number of copies of the subgroup desired in the **SUBGROUP** command. This example specifies that two copies of the first subgroup and three copies of the second subgroup are to be printed. The next figure shows the result of printing a job that includes overlays as specified in the sample command stream at the beginning of this example.

Two Electronic Overlays Incorporated into Two Subgroups

Overlay SLSRPT

Overlay M1002

Printing Constant Forms

This example shows how to specify the constant-forms function using the **CONSTANT** command. The constant-forms function allows you to print overlays or a forms flash on blank pages without adding blank pages to your print job. Instead, the **CONSTANT** command generates blank pages on which to print the requested overlays and forms flash. These pages are called *constant forms* because no variable data from the print file is printed on the pages.

You specify the **CONSTANT** command for an entire copy group; you identify the overlays and forms flash in the subgroups of the copy groups.

The sample form definition XMPXXX shown below specifies that overlay XMP be printed on the back of each sheet with no variable data from the print job. The data from the print file is printed only on the front side of each sheet.

```
FORMDEF XMPXXX
  REPLACE YES
  DUPLEX NORMAL ;
COPYGROUP XMPXXY
  CONSTANT BACK ;
  OVERLAY XMP;
  SUBGROUP FRONT ;
  SUBGROUP BACK
    OVERLAY XMP;

PAGEDEF XMPXXX
  REPLACE YES ;
  FONT NORMALFONT GT10 ;
  PAGEFORMAT XMPXXX ;
  PRINTLINE CHANNEL 1 REPEAT 20
    POSITION 1 1 ;
```

The steps to write this form definition are:

1. Create a copy group.
 - 1) Specify duplex printing.
 - 2) Specify printing of a constant form as the back side of each sheet.
 - 3) Write an **OVERLAY** command.
2. Create two subgroups by writing two **SUBGROUP** commands. The subgroup for the back side specifies the overlay to be printed.

↓ Note

If you do not specify an overlay in the subgroup for the back, the back side of each sheet will be blank.

Duplex Printing

Printing on both sides of a sheet (duplex printing) can be done in two ways: by the use of the **FRONT** and **BACK** subcommand combination or by the use of the **BOTH** subcommand. If **FRONT** and **BACK** are chosen, the number of copies requested for each must be the same.

To demonstrate some of the functions available for duplex printing, assume you want to print a six-page data file (a simplified version is shown in the next figure).

Six-Page Formatted Data File

Page 1	Data File
Page 2	
Page 3	
Page 4	
Page 5	
Page 6	

Assume, too, that the file is already composed and formatted, so only a form definition is needed. The first form definition follows:

```
FORMDEF ABCD
    DUPLEX NORMAL ;
    OVERLAY AB ;
    SUBGROUP FRONT
        OVERLAY AB ;
    SUBGROUP BACK ;
```

In this command stream, form definition ABCD contains two subgroups, one specified with a **FRONT** subcommand and the other with a **BACK** subcommand.

By including a pair of **FRONT** and **BACK** subcommands within the copy group, you can specify that the front and back of printed sheets are to be controlled by different subgroups. The purpose of this is to allow modifications (overlays or suppressions, for example) to be separately specified for the front and back of sheets. The next figure shows the result of using this control where the front sheets have a header (OVERLAY AB) that the backs do not have.

Result of Using a Pair of FRONT and BACK Subgroups

The rules of the **FRONT** and **BACK** subcommands are:

- **FRONT** and **BACK** subgroups must be specified in pairs.
- Subgroups specifying **FRONT** must always immediately precede subgroups specifying **BACK**.
- **FRONT** and **BACK** subgroups must agree in the number of copies.

The **BOTH** subcommand also can be used with a form definition or a copy group that specifies duplex printing. An example of this type of form definition is:

```
FORMDEF EFGH
    DUPLEX NORMAL ;
    SUBGROUP BOTH
        COPIES 2 ;
```

The form definition EFGH contains only one **SUBGROUP** command.

↓ **Note**

1. The copy group actually contains the subgroup, but if a form definition contains only one copy group, the copy group need not be specified.
2. With the **BOTH** subcommand, you specify only one subgroup: both sides of all sheets have the same modifications.
3. The above form definition does *not* put the same data on the front and back of the same sheet. Internally to PPFA, a single **BOTH** subgroup actually produces two subgroups. As a result, two pages of data (one for each internal subgroup) are processed before copy number 2 is made. For more information about this topic, see [SUBGROUP Command, p. 265](#).

The next figure shows a sample print resulting from using the FORMDEF EFGH specifying **BOTH** to control the printing of the six-page (2 copies) data file.

Form Definition EFGH Using DUPLEX with BOTH

Duplex Printing in Portrait and Landscape Presentations

Duplex printing with PPFA and your print server printers offers several other options. This example shows the combination of portrait and landscape presentations with normal and tumble duplex printing.

 **Note**

The terms normal, tumble, portrait, and landscape are used in this example. They are explained in this chapter and in the Glossary.

NORMAL and **TUMBLE** are parameters of a **DUPLEX** subcommand. For example, a form definition specifying **DUPLEX NORMAL** could be written this way:

```
FORMDEF ABCD ;
COPYGROUP ABCD
          DUPLEX NORMAL ;
SUBGROUP BOTH
          COPIES 1 ;
```

Document A in Figure [DUPLEX NORMAL: Portrait and Landscape Presentation, p. 35](#) shows the result of a **DUPLEX NORMAL** specification in the portrait presentation. Document D shows the result of the same form definition when a landscape presentation is specified. The printout in landscape presentation is really in a tumble-duplex format, having the tops (of the front side) and the bottoms (of the back side) of the logical pages toward the same edge of the sheet.

Although tumble duplex can be specified in this manner for landscape pages, another parameter, **RTUMBLE** (rotated tumble), exists to make the form definition look more sensible for use in landscape print jobs. It also produces the results shown in Figure [DUPLEX NORMAL: Portrait and Landscape Presentation, p. 35](#), depending on whether the form definition called for portrait or landscape presentation. For landscape, the form definition should be written as follows:

```
FORMDEF ABCD
PRESENT LANDSCAPE ;
COPYGROUP ABCD
          DUPLEX RTUMBLE ;
SUBGROUP BOTH
          COPIES 1 ;
```

 **Note**

The example presented is for continuous printers. You must use **N_UP** for cut-sheet printers. In [Form Definition Command Reference, p. 208](#), see the **PRESENT** subcommand of **COPYGROUP**.

DUPLEX NORMAL: Portrait and Landscape Presentation

The **DUPLEX NORMAL** and **DUPLEX RTUMBLE** controls actually produce the same result on the physical page. **RTUMBLE** is used to maintain an association between duplex specifications and logical page print direction. The same relationship exists between the **RNORMAL** and the **TUMBLE** parameters as exists between the **NORMAL** and the **RTUMBLE** parameters; that is, within the two sets the terms are interchangeable.

For example, you could write a form definition using **DUPLEX TUMBLE** as follows:

```
FORMDEF DEFG ;
COPYGROUP DEFG
    DUPLEX TUMBLE ;
SUBGROUP BOTH
COPIES 1 ;
```

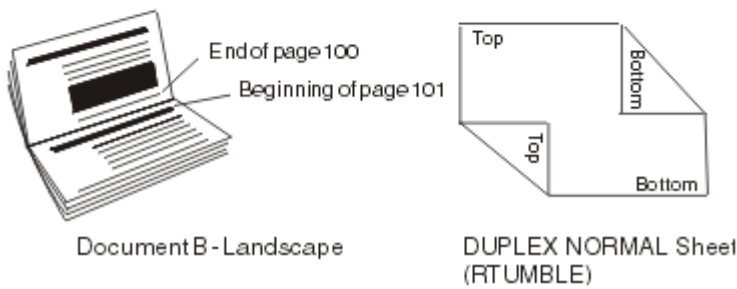

Documents C and B in Figure [Result When Either TUMBLE or RNORMAL Is Specified, p. 36](#) are the results, depending on how page definition direction is specified to achieve either a portrait page or a landscape page.

Result When Either TUMBLE or RNORMAL Is Specified

Document C - Portrait

DUPLEX TUMBLE Sheet

Document B - Landscape

DUPLEX NORMAL Sheet (RTUMBLE)

To help you remember, use the next table [Duplex Specifications, p. 36](#).

Duplex Specifications

If the form definition duplex specification is...	and if the page definition direction is...	then, the duplex printing result is...
DUPLEX NORMAL	ACROSS or BACK	Normal duplex: portrait
DUPLEX RTUMBLE	DOWN or UP	Tumble duplex: landscape
DUPLEX TUMBLE	ACROSS or BACK	Tumble duplex: portrait
DUPLEX RNORMAL	DOWN or UP	Normal duplex: landscape

Note

Other control combinations are not recommended.

Specifying Page Presentation on Continuous-Forms Printers

This example shows how to specify the page presentation (portrait or landscape) on printers that use continuous-forms paper. The page presentation is specified in the form definition using the **PRESENT** subcommand in conjunction with the **DIRECTION** subcommand.

The **PRESENT** subcommand specifies how your pages will be presented when they are printed and has two valid values: **PORTRAIT** and **LANDSCAPE**.

The **DIRECTION** subcommand specifies the inline direction in which your pages have been formatted by the page definition (see [FIELD Command, p. 312](#)) or by the program formatting the data. The **DIRECTION** subcommand has two valid values: **ACROSS** and **DOWN**.

The conditions in which you should use these subcommands and some conditions in which they are not required are described below. For more information about how these subcommands work with data sent to specific printers, refer to the appropriate printer documentation.

In order to understand the description that follows, you must be aware of the difference between the two types of continuous forms: *narrow* and *wide*. Narrow forms are forms that have perforations on the shorter edge of the paper and tractor holes on the longer edge. Wide forms are forms that have perforations on the longer edge of the paper and tractor holes on the shorter edge. The two types of forms are illustrated in Figure [Narrow and Wide Continuous Forms, p. 37](#).

Narrow and Wide Continuous Forms

When to Use the PRESENT and DIRECTION Subcommands

You should use the **PRESENT** and **DIRECTION** subcommands if you are building a form definition that will be used:

- With wide forms on an continuous forms printer when the print data has been formatted in the **DOWN** print direction (see [The DOWN Direction for Continuous Forms Printers, p. 38](#))
- When you do not know which type of form (narrow or wide) will be used on an continuous forms printer (see [The DOWN Direction for Continuous Forms Printers, p. 38](#))

Note

References to an continuous forms printer point of origin also applies to all continuous-forms printers except the 3800.

When the PRESENT and DIRECTION Subcommands Are Not Required

You do not need to use the **PRESENT** and **DIRECTION** subcommands if you are building a form definition that will be used:

- With cut-sheet printers only
- With narrow forms only

- With the 3800 printer only
- With print data that has been formatted in the **BACK** direction by the page definition or the program formatting the data

The DOWN Direction for Continuous Forms Printers

2

If your data has been formatted in the **DOWN** print direction for landscape page presentation and is to be printed on wide forms on an continuous forms printer, you must specify **LANDSCAPE** on the **PRESENT** subcommand to produce readable output.

If **PRESENT LANDSCAPE** and **DIRECTION DOWN** are not specified on the **FORMDEF** command, the data is printed in the landscape presentation; however, the data will be upside down, as shown in the next Figure. The data is upside down in this case because the media origin for an continuous forms printer is located on the same corner of the form, regardless of whether a narrow or wide form is being used.

The Results of Not Specifying PRESENT LANDSCAPE and DIRECTION DOWN on an Continuous Forms Printer

If **PRESENT LANDSCAPE** and **DIRECTION DOWN** are specified on the **FORMDEF** command, the data will be printed as shown in Figure [The Results of Specifying PRESENT LANDSCAPE and DIRECTION DOWN on an Continuous Forms Printer, p. 39](#). In this example, line data is formatted using a page definition.

PRESENT LANDSCAPE and **DIRECTION DOWN** can also be specified for data formatted in the **DOWN** print direction that will be printed on narrow forms. Although **PRESENT LANDSCAPE** and **DIRECTION DOWN** do not need to be specified in this case in order to produce readable output, specifying them enables you to use the same form definition regardless of whether the data will be printed on wide forms or narrow forms.

Note

If you are building a form definition that can be used with both wide and narrow forms, remember that the left margin as viewed by the reader becomes the top margin from the printer's perspective (and vice versa). Because many printers have an unprintable area at the margins, you should position the logical page using the **OFFSET** subcommand in the form definition, so data will not be placed in the unprintable area on either wide or narrow forms.

The Results of Specifying PRESENT LANDSCAPE and DIRECTION DOWN on an Continuous Forms Printer

Print Quality Control

If your printer has more than one print-quality selection, you can specify different levels of print quality. For more information refer to the manual for your printer.

Using Page Definition Commands for Traditional Line Data

A *page definition* specifies how you want data positioned on the logical page.

A page definition is a resource used by print servers to define the rules of transforming line data and unformatted ASCII into composed pages and text controls for printing. With page definitions, you can perform the tasks listed in this table:

Page Definition Tasks

Tasks	Location of Example
Creating a page definition	Page Definition Command Nesting, p. 40
Defining logical page size	Defining Logical Page Size, p. 41

Tasks	Location of Example
Positioning data on a logical page	Positioning the First Line of Data, p. 42
Changing the print direction	Changing Logical Page Print Direction, p. 44
Printing line data	Printing Line Data on a Print Server Printer, p. 46
Processing fields	Processing Fields, p. 50
Changing fonts	Varying Fonts on a Page, p. 52
Printing in different directions	Printing Lines in Two Directions on a Page, p. 55
Printing fields in two directions	Printing Fields in Two Directions on the Same Page, p. 55
Rotating fonts	Rotating Fonts, p. 56
Printing kanji	Using Traditional Kanji Formatting, p. 58
Printing multiple up	Printing Multiple-Up Pages, p. 58

Page Formats within Page Definitions

Just as form definitions can include more than one copy group, page definitions can include several *page formats*. Page formats use the same subcommands (except **REPLACE**) as page definitions, and if a subcommand is specified in a page format, it overrides the value specified in the page definition for the page format. A single page definition may contain multiple page formats. If pages in a file are to be formatted differently, specify more than one page format in your page definition. Within a page definition, page formats are generated in the order in which they are specified.

Using more than one page format to control different pages requires one of the following:

- Adding the Invoke Data Map structured field to the data file each time you want to change page formats
- Using conditional processing

Refer to *Advanced Function Presentation: Programming Guide and Line Data Reference* for more information about the Invoke Data Map structured field.

Page Definition Command Nesting

The following simplified command stream shows the proper nesting of commands and the order in which they must be entered when you create a page definition:

```
[SETUNITS]
PAGEDEF
  [FONT]
  [OBJECT]
  [PAGEFORMAT]
  [TRCREf]
```

```

[OBJECT]
[SEGMENT]
[OVERLAY]
  PRINTLINE
  [FIELD]
  [CONDITION]
[ENDSUBPAGE]
[SETUNITS]

```

↓ Note

1. Brackets enclosing a command mean the command is optional.
2. A command and its subcommands end with a semicolon.
3. Indentations are used to improve readability.
4. Complete definitions of all commands are included in [Page Definition Command Reference](#), p. 269.

Command Nesting Rules

1. **FONT** commands must be specified immediately after **PAGEDEF** commands.
2. A **SETUNITS** command can be specified anywhere in the PPFA command stream and is in effect until another **SETUNITS** command is specified.
3. **OBJECT** commands may appear after the **FONT** command, before any **PAGEFORMAT** command (global objects) or after a specific **PAGEFORMAT** command. A global object is defined for all page formats in the page definition. Otherwise the object is just defined for the **PAGEFORMAT** in which it is specified.
4. **TRCREf**, **SEGMENT**, and **OVERLAY** commands must be specified under their associated **PAGEFORMAT** command.
5. The first **PAGEFORMAT** command can be omitted in a page definition, if the page definition has only one page format.
6. At least one **PRINTLINE** command is required.

Defining Logical Page Size

[Positioning a Logical Page on a Sheet](#), p. 27 shows how to establish the origin point of a logical page, relative to the media origin on a sheet of paper, using the `OFFSET` subcommand. The following example shows you how to establish the width and height of the logical page relative to this origin point. This example illustrates how the dimensions of a logical page are determined by form definitions and page definitions.

```

FORMDEF ABCD
  OFFSET (1)(2) ;
PAGEDEF ABCD
  WIDTH (3)
  HEIGHT (4) ;
  PRINTLINE ;

```

↓ **Note**

The parenthetical numbers represent dimensions. Figure [Logical Page Dimensions](#), p. 42 shows how these dimensions relate to the logical page.

Normally, all parameters consist of a number and a unit of measurement, for example, 6 IN. (See [Units of Measurement](#), p. 207 for information on units that are available.) Numbers can be specified with up to three decimal places. The **PRINTLINE** command is included because at least one is required for all page definitions; see [PRINTLINE Command \(Traditional\)](#), p. 405 for more information.

2

Logical Page Dimensions

The **OFFSET** subcommand (1) (2) in the sample form definition establishes the corner or origin of the logical page relative to the physical sheet. The **WIDTH** and **HEIGHT** subcommands, (3) and (4), specify the dimensions of the logical page relative to the logical page origin.

↓ **Note**

Be careful not to define a logical page larger than the physical sheet. PPFA does not check the size of the physical sheet.

[Positioning the First Line of Data](#), p. 42 shows you two ways to position the first line of data on the page.

Positioning the First Line of Data

The previous section showed you how to define the size of a logical page. The next two examples show you how to position the first line of data inside the logical page, using the **LINEONE** subcommand. This subcommand position is relative to the logical page origin, as shown in Figure [LINEONE Coordinates](#), p. 43. The two coordinates, (1) and (2), of the **LINEONE** parameter define the starting point for the first line of text.

LINEONE Coordinates

This starting point works with the **POSITION**, **MARGIN**, and **TOP** subcommands (of the **PRINTLINE** command) to position lines of print on a page.

The defaults for **LINEONE** are:

```
x = 0,
y = 80% of one line space from the top of the logical page:
    80% of 1/6 inch if lines per inch (lpi) = 6,
    80% of 1/8 inch if lpi = 8, and so on.
```

These defaults leave room for the character ascenders in the first line of text.

Note

PPFA subtracts one logical unit (L-unit) from the y value to compensate for the fact that the printer counts L-units beginning with the number 0. Therefore, if you specify the offsets to the first line in L-units (**PELS** is the measurement command for L-units) using the **LINEONE** subcommand, you must remember to subtract one L-unit from the y offset value. This is necessary to prevent descenders on the last printed line from dropping off the bottom of the logical page.

The following examples illustrate two methods for positioning the first line of text:

1. The position of the first line of data defaults by specifying the **SETUNITS** command prior to the **PAGEDEF** command, like this:

```
SETUNITS 1 IN 1 IN
          LINESP 8 LPI;
FORMDEF  ABCD
          OFFSET 0 .5;
PAGEDEF  ABCD
          WIDTH 7.5
          HEIGHT 10
          DIRECTION ACROSS;
          FONT GS12 GS12;
PRINTLINE REPEAT 60
          FONT GS12
          POSITION 0 TOP;
```

Note

It is important that the **LINESP** subcommand (of the **SETUNITS** command) must precede the **PAGEDEF** commands.

If the **LINESP** subcommand *follows* the **PAGEDEF** command, PPFA then uses the default **LINESP** value to calculate the y offset value, which is used to position the first line of print.

The default for the **LINESP** subcommand of the **SETUNITS** command is 6 lpi. If **LINEONE** is allowed to default, based upon the **LINESP** default, the **LINEONE** value is 31 L-units:

$$\text{LINEONE} = ((240 \text{ L-units} / 6 \text{ lpi}) \times 80\%) - 1 \text{ L-unit} = 31 \text{ L-units}.$$

This value is the vertical (y) position of the printline because **TOP** is specified in a later **POSITION** subcommand. However, this value may cause the data to exceed the bottom boundary of the logical page if the **LINESP** value is changed later.

- Another way you can specify the starting position for the first print line is to specify **LINEONE** explicitly, like this:

```
FORMDEF ABCD
  OFFSET 0 .5;
PAGEDEF ABCD
  WIDTH 7.5
  HEIGHT 10
  LINEONE 0 PELS 23 PELS
  DIRECTION ACROSS;
SETUNITS 1 IN 1 IN
  LINESP 8 LPI;
  FONT GS12 GS12;
  PRINTLINE REPEAT 60
    FONT GS12
    POSITION 0 TOP;
```

In this example, the **LINESP** subcommand following the **PAGEDEF** command will not cause a data placement problem because the **LINEONE** command determines explicitly where the first line of text is positioned, and no default **LINESP** value is used:

$$\text{LINEONE} = [(240 \text{ L-units} / 8 \text{ lpi}) \times 80\%] - 1 \text{ L-unit} = 23 \text{ L-units}$$

If you use the **LINEONE** command to specify an absolute starting position for the first line, in L-units, you must remember to subtract one L-unit from that value.

Changing Logical Page Print Direction

Logical pages can have four different print directions: **ACROSS**, **DOWN**, **BACK**, and **UP**.

This example shows that all four directions can be specified in relation to one offset specification:

```
FORMDEF ABCD
  OFFSET (1) (2) ;
PAGEDEF DEFG ;
PAGEFORMAT DEFG1
  WIDTH (3)
  HEIGHT (4)
  DIRECTION ACROSS ;
  PRINTLINE ;
PAGEFORMAT DEFG2
  WIDTH (3)
  HEIGHT (4)
  DIRECTION DOWN ;
  PRINTLINE ;
PAGEFORMAT DEFG3
  WIDTH (3)
  HEIGHT (4)
  DIRECTION BACK ;
  PRINTLINE ;
```

```

PAGEFORMAT DEFG4
          WIDTH (3)
          HEIGHT (4)
          DIRECTION UP ;
PRINTLINE ;

```

One page definition is used to simplify the example, yet four logical pages are specified. The **PAGEFORMAT** commands create subsets of page definitions for each logical page.

Note

The page formats in this example require an Invoke Data Map structured field at the place in the data file where you want to change page formats. The **PRINTLINE** commands are required but are not relevant in the example.

The **DIRECTION** subcommand with one of its four direction parameters (**ACROSS**, **DOWN**, **UP**, or **BACK**) specifies the print direction of the logical page.

Figure [Logical Page Print Directions in Relation to Origin, p. 45](#) shows the format of each of the logical pages specified in the page definition with the direction specification of each. The pages with the **ACROSS** and **BACK** directions are in portrait presentation. The pages with the **DOWN** and **UP** directions are in landscape presentation.

Logical Page Print Directions in Relation to Origin

The media origins and logical page origins do not change with the presentation of the data on the page. The **OFFSET** subcommand of the form definition need not change. However, the width and height dimensions do change; that is, the **WIDTH** subcommand always governs the horizontal (inline) dimension as you view the page, and the **HEIGHT** subcommand always governs the vertical (baseline) dimension whether the page is in portrait or in landscape presentation. Ensure that these specifications do not cause the logical page to cross the edge of the physical page.

However, if the **DOWN** direction is specified for use with an continuous forms printer, the **PRESENT** and **DIRECTION** subcommands may need to be specified in the form definition. See [Specifying Page Presentation on Continuous-Forms Printers, p. 36](#) for more information.

Printing Line Data on a Print Server Printer

This example shows how you can print a data file developed for a line printer on a page printer without altering the data. The example compares the effects of line printer controls with the corresponding controls in the PPFA commands and subcommands. **PRINTLINE**, **LINESP**, **POSITION**, **CHANNEL**, and **REPEAT** are page definition controls related to the lines of text in your printout. Line printer controls examined are the forms control buffer (FCB) and carriage control characters.

As shown in Figure [Line-Data File, p. 46](#), a file consisting of 13 records is to be printed. Several different printouts of this data are formatted in the following examples. In the first two printouts, records 1–6 are printed on page 1, records 7–9 on page 2, and records 10–13 on page 3.

Line-Data File

Carriage-Control Character

1	RECORD 1
	RECORD 2
	RECORD 3
	RECORD 4
	RECORD 5
	RECORD 6
1	RECORD 7
	RECORD 8
	RECORD 9
1	RECORD 10
	RECORD 11
	RECORD 12
	RECORD 13

Data

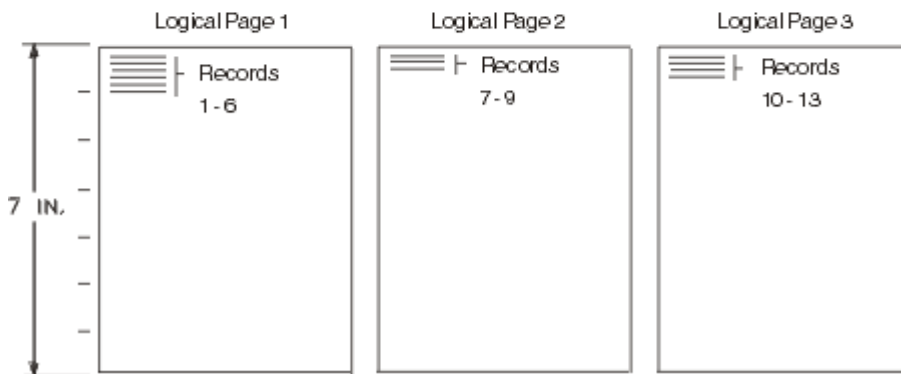

Figure [Data File Printed on a Line Printer, p. 47](#) shows the formatting process used when the file is printed on a line printer. For many line printers, an FCB is used to format the output in the S/370 (OS/390 and z/OS, VM, VSE) environment. The sample FCB represented in Figure [Data File Printed on a Line Printer, p. 47](#) determines that no printed page contain more than eight lines. A page can have exactly eight lines without using carriage control characters in the data. A page may contain any number of lines fewer than eight; this is effected by placing fewer than eight records between the carriage control characters in the data. In the data file in data file in the previous figure, fewer than eight records are, in all cases, placed between channel 1 carriage control characters. A ninth record, if encountered before a carriage control character, would cause a page eject and a return to the beginning of the FCB. The printout shown in Figure [Data File Printed on a Line Printer, p. 47](#) results from the data being formatted by this FCB.

Data File Printed on a Line Printer

FCB

Line No.	LPI	Channel
1	6	1
2	6	
3	6	
4	6	
5	6	
6	6	
7	6	
8	6	

Printout

A page definition can work exactly the same way. Consider the following example:

```

SETUNITS 1 IN 1 IN
      LINESP 6 LPI ;
PAGEDEF ABCD
      WIDTH 5
      HEIGHT 7
      LINEONE .5 .5 ;
PRINTLINE CHANNEL 1
      POSITION MARGIN TOP
      REPEAT 8 ;
  
```

This command stream contains one new command (**PRINTLINE**) and four new subcommands (**LINESP**, **CHANNEL**, **POSITION**, and **REPEAT**) related to controlling individual lines.

- The **LINESP** subcommand has the same function as the LPI specifications in the FCB or in a Printer File; it defines the line density in lines per inch.
- The **PRINTLINE** command contains the controls for one or more lines.
- The **CHANNEL** subcommand has the same function as the channel 1 control character in the FCB, causing a page eject at each channel 1 control character encountered in the data records.
- The **POSITION** subcommand establishes the location of the first line relative to the upper-left corner of the logical page. This example uses the **MARGIN** and **TOP** parameters; however, numeric parameters similar to those used with the **OFFSET** subcommand can also be used. Those values are also relative to the logical page.

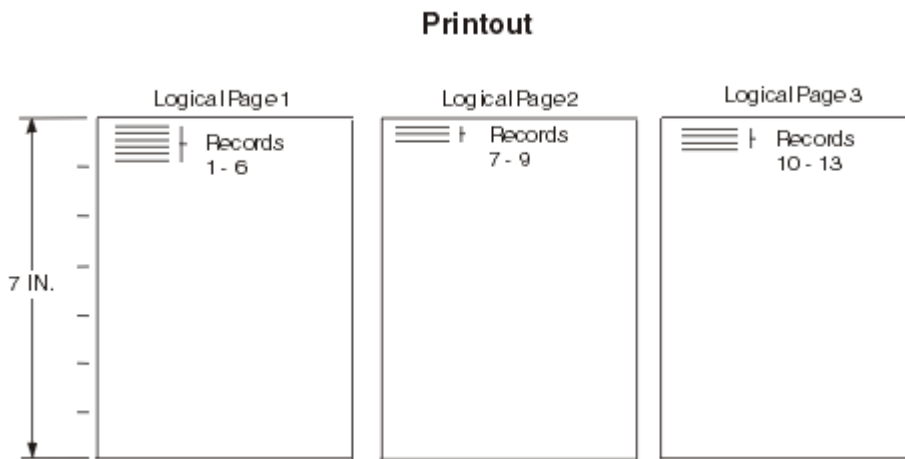

- The **REPEAT** subcommand is a commonly used control in PPFA text formatting. It is the way you specify the total number of **PRINTLINES** in a logical page.

Note

The constraints in specifying a **REPEAT** value and, thereby, the number of lines per page are: the lines-per-inch specification, the height of the logical page, and the font selection. The **REPEAT** variable "8" is chosen to equal the maximum number of records to be printed per page. As in the line printer version, if a ninth record were encountered before a channel 1 carriage control character, a page eject would occur and the line would be printed as the first line at the top of the next page.

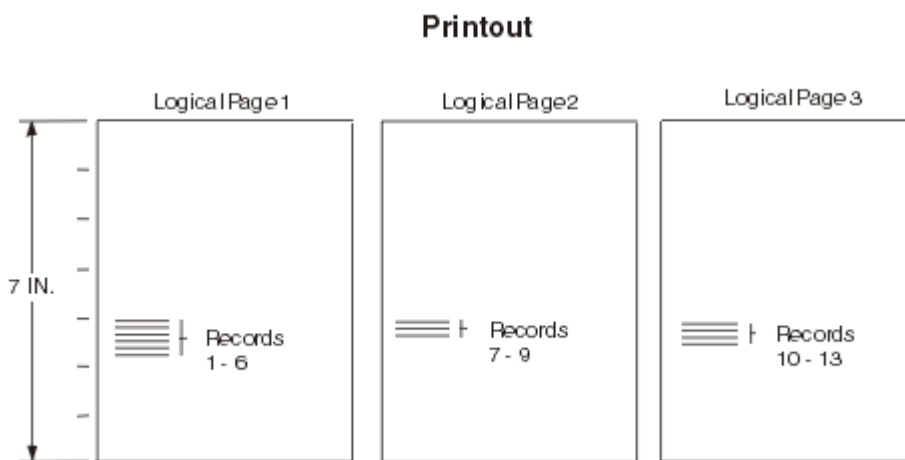

The result of this page definition is represented in the next figure.

Printout Examples Specifying POSITION MARGIN TOP

Changing line printing specifications for the following example is shown in Figure [Printout Example Specifying POSITION MARGIN 4.1, p. 48](#).

Printout Example Specifying POSITION MARGIN 4.1

```
SETUNITS 1 IN 1 IN
      LINESP 6 LPI ;
PAGEDEF ABCD
      WIDTH 5
```

```

HEIGHT 7
LINEONE .1 .1 ;
PRINTLINE CHANNEL 1
      POSITION MARGIN 4.1
      REPEAT 8 ;

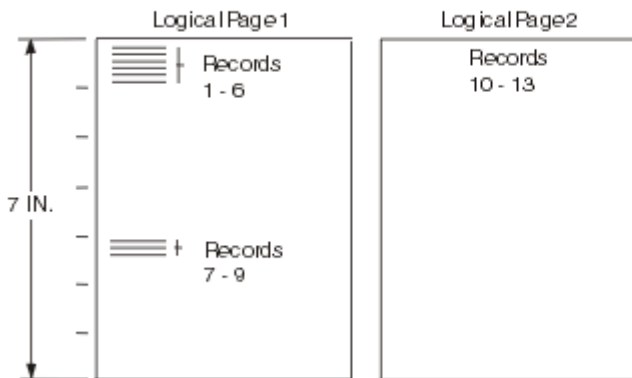

```

Observe that the second parameter of **POSITION** is no longer **TOP**; instead it is 4.1, which places the first line of text 4.1 inches down the page rather than at the top.

Printout Example Specifying **POSITION MARGIN TOP** and **POSITION MARGIN 4.1**

2

Printout

The following example and the previous figure show a third version of the possible formats for the data represented in Figure [Data File Printed on a Line Printer, p. 47](#).

```

SETUNITS 1 IN 1 IN
      LINESP 6 LPI ;
PAGEDEF ABCD
      WIDTH 5
      HEIGHT 7
      LINEONE .1 .1 ;
PRINTLINE CHANNEL 1
      POSITION MARGIN TOP
      REPEAT 8 ;
PRINTLINE CHANNEL 1
      POSITION MARGIN 4.1
      REPEAT 8 ;

```

You also can skip over space using carriage control characters. This example shows how to do this by using a second **PRINTLINE** command to create a second starting position on the page. The second starting position is vertically 4.1 inches down from the top of the page; see the second **POSITION** subcommand. The two **CHANNEL 1** subcommands take turns mapping the records governed by the successive channel 1 carriage control characters in the data to their specified positions on the page. In this case, the carriage control 1 characters cause printing to alternate between the **TOP** position (0.1 inch down the page) and 4.1 inches down the page.

Processing Fields

This section describes the mapping of individual fields to the printed sheets. The technique allows you to print unformatted data according to precise specifications, and these specifications can change without affecting the data file.

The rules for field processing of data files are:

- Each record in your file must correspond to a separate **PRINTLINE** command because each record is mapped separately. When processing identical fields, you can define a single printline and use the **REPEAT** subcommand.
- Each **FIELD** command must follow its associated **PRINTLINE** command, and more than one **FIELD** command can be specified for a single **PRINTLINE** command.

For this field-processing example, the data file shown in the next figure is used. Figure [Data Arranged on the Printed Page, p. 51](#) represents an output format that could be used to place data on a form, such as an invoice or an order. The page definition commands to print Figure [Data Arranged on the Printed Page, p. 51](#) are as follows:

```
PAGEDEF ABCD
      WIDTH 7 IN
      HEIGHT 8 IN ;
PRINTLINE POSITION 1 IN 1 IN ; /*PROCESSING FOR R1          */
      FIELD START 1 LENGTH 4 ; /*THE PRINTLINE POSITION IS    */
                                  /*THE DEFAULT FOR THE FIRST FIELD*/

      FIELD START 11 LENGTH 4
      POSITION 4 IN 0 IN ;
PRINTLINE POSITION 3 IN 4 IN ; /*PROCESSING FOR R2          */
      FIELD START 1 LENGTH 4 ; /*DEFAULT POSITION             */
      FIELD START 6 LENGTH 4
      POSITION 0 IN 1 IN ;
      FIELD START 13 LENGTH 3
      POSITION 2 IN 3 IN ;
PRINTLINE POSITION 1 IN 2 IN ; /*PROCESSING FOR R3          */
      FIELD START 1 LENGTH 4 ; /*DEFAULT POSITION             */
      FIELD START 11 LENGTH 4
      POSITION 4 IN 0 IN ;
```

Unformatted Print Data File

	1	2	3	4	5	6	7	8	9	1	2	3	4	5	6	7
R1	A	A	A	A						B	B	B	B			
R2	X	X	X	X	Y	Y	Y	Y		Z	Z	Z	Z			
R3	1	1	1	1						2	2	2	2			

Data File

Data Arranged on the Printed Page

POSITION Subcommand as Used in this Example

The **POSITION** subcommand of each **PRINTLINE** command specifies the printline position relative to the logical page origin. The **POSITION** subcommands below **FIELD** commands specify a field position relative to the governing printline position. Following **POSITION** subcommands come the horizontal (x) then the vertical (y) offsets from the reference point. They are parallel in structure to the **OFFSET** subcommand of the form definition.

For example, the final **POSITION** subcommand places the final field 1 + 4 inches to the right of the left edge of the logical page, combining the x value of 1 in the **PRINTLINE** command, and the x value of 4 in the nested **FIELD** command. The 0 in the **FIELD** command specifies no change to the y value in the **PRINTLINE** command. Thus, the position of the final field is 5 IN (x), 2 IN (y).

Note

The first **FIELD** command within each **PRINTLINE** has no position specification, because the **PRINTLINE POSITION** value is the default for the first **FIELD** command nested under it.

Alternate controls for the x and y values of a **POSITION** subcommand are available. See the description of the **POSITION** subcommand in [FIELD Command, p. 312](#) and [PRINTLINE Command \(Traditional\), p. 405](#).

FIELD Command as Used in this Example

In the **FIELD** command, the **START** and **LENGTH** parameters specify the location of the field in the record to be processed. **START** indicates the starting byte position, and **LENGTH** specifies the number of bytes in the field.

Because a field can be located independently within the data and on the printed page, more than one page definition or page format can be created for the same data file, each specifying different mapping of the data to the output pages.

Varying Fonts on a Page

This example illustrates a simple font variation within a printout. The task is to print a line-data file having the first line of each page in bold-faced type and the rest in standard type. This requires controls for two fonts in the page definition.

The commands to select a single font for the page, as shown in Figure [Data File Printed Using a Single Font, p. 52](#), are as follows:

The **FONT** command contains two names: the local (STANDARD) name and the user-access (M101) name for the selected font.

```
PAGEDEF ABCD ;
  FONT STANDARD M101 ;
  PRINTLINE ;
```

Note

Fonts cannot be an FGID. Also, all page definitions require a **PRINTLINE** command.

Page 3

The next command stream changes the font by incorporating a **TRCREF** command. Assume the data file to be formatted incorporates table reference characters (TRCs) as shown in Figure [Font Change Using TRCREF Command, p. 53](#).

```
PAGEDEF ABCD ;
  FONT STANDARD M101 ; /*CREATING LOCAL FONT NAMES */
```

```

FONT BOLDFACE M102 ;
PAGEFORMAT ABCD ;
  TRCREF 0                      /*DEFINING THE TRC VALUES */
      FONT STANDARD ;
  TRCREF 1
      FONT BOLDFACE ;
PRINTLINE CHANNEL 1
      POSITION 1 IN 1 IN
      REPEAT 8 ;

```

Font Change Using TRCREF Command

	0	Record 9
1	1	Record 10
	0	Record 11
	0	Record 12
	0	Record 13

Data

Bold Face

The TRCs in the data cause the font switch to be made. The **TRCREF** command equates a TRC in the data file with the local name of a font specified in the **FONT** command. The **FONT** command also contains the user-access name for the font. See [Character Length for PFA Names, p. 205](#) for information on local names and user-access names. Because of the relationship among the user-access name, the local name, and the TRC number that is established in the page definition, the TRCs in the data can cause a font switch automatically.

You can specify fonts within a **PRINTLINE** command when the data file contains no TRCs. For example:

```

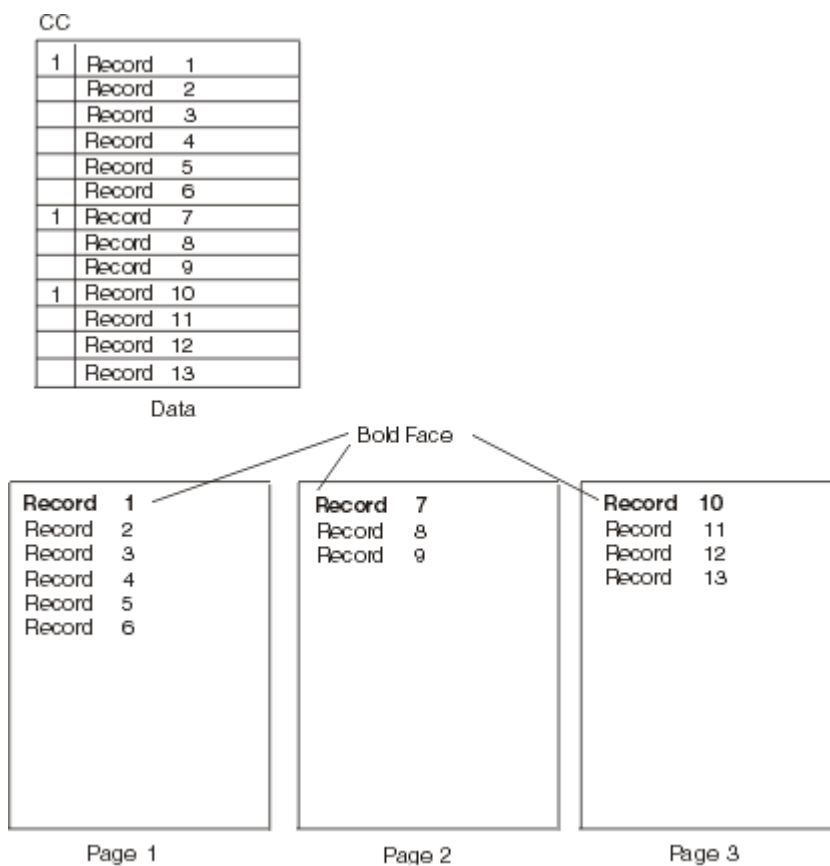

PAGEDEF ABCD ;
  FONT M101 ;
  FONT BOLDFACE M102 ;
  PRINTLINE CHANNEL 1                      /*BOLDFACE LINE */
      POSITION MARGIN TOP
      FONT BOLDFACE ;
  PRINTLINE POSITION MARGIN NEXT          /*STANDARD-TYPE LINE */
      FONT M101
      REPEAT 7 ;

```

Assume the data file represented in the sample print in Figure [Font Change Using FONT Commands and Subcommands](#), p. 54 is to be formatted by this page definition.

This command stream, based on a data file without TRCs, works on the principle that each line of output whose font you want to change from the font in the previous line must be controlled by a separate **PRINTLINE** command. The **FONT** subcommand of the **PRINTLINE** command names the font desired for that line. In this example, two **PRINTLINE** commands are used because one font change and two fonts are intended for the output. The user-access font names appear in the two **FONT** commands immediately below the **PAGEDEF** command and, optionally, a local name. M101 and M102 in the example are user-access names; **BOLDFACE** is a local name. Use the local name in the **FONT** subcommand of **PRINTLINE** if it is included in the corresponding **FONT** command, as is done for the first **PRINTLINE** command.

Font Change Using FONT Commands and Subcommands

Changing fonts field by field is similar to changing them in **PRINTLINE**s. You map each field individually with a **FIELD** command; include a **FONT** subcommand in the **FIELD** command. If a font change is desired for a field, as with the **FONT** subcommand of a **PRINTLINE** command, the font must be previously named in a **FONT** command.

Two possible defaults apply in case you do not specify a font within a field. If the governing **PRINTLINE** has a **FONT** subcommand, it contains the font default for the field. If the governing **PRINTLINE** has no font specification, the print server assigns a font according to its default rules.

Printing Lines in Two Directions on a Page

Lines can be printed in any of four directions, depending on the type of printer being used.

The four parameters for line direction are **ACROSS**, **DOWN**, **BACK**, and **UP**. The PPA commands used to format a line-data file with lines printed in more than one direction (as shown in the next figure) are stated in the following page definition:

```
PAGEDEF ATOG
  DIRECTION ACROSS ;
  PRINTLINE POSITION 1 IN 1 IN      /*LINES A-E   */
    REPEAT 5 ;
  PRINTLINE POSITION .5 IN 6 IN     /*LINE  F    */
    DIRECTION UP ;
  PRINTLINE POSITION 1 IN 6 IN ;    /*LINE  G    */
```

A Printout with More Than One Line Direction

In this page definition, the logical page direction **ACROSS** is specified. This is actually the default, but its inclusion clarifies that no direction control is needed for lines A–E. The default direction of a printline is the direction specification of the logical page of which it is part. The **PRINTLINE** command for the record F has a **DIRECTION** subcommand because the direction specification changes from that of the previous line. Record G is to be printed in the **ACROSS** direction again. A direction is not specified, however, because the **ACROSS** direction is the default for all lines in this page definition.

Note

If you are building the page definition for use with the 3800 printer, and if the input data contains table reference characters, you can use the **DIRECTION** subcommand of the **TRCREF** command to specify a font that prints **UP** on the page, as in line F. For more information, see [TRCREF Command \(Traditional\)](#), p. 427.

Printing Fields in Two Directions on the Same Page

This example is similar to Figure [Printing Lines in Two Directions on a Page, p. 55](#), except that you learn how to control direction field by field. This method creates a field-processing page definition and places direction controls in the **FIELD** commands. This command stream contains a portion of the page definition controls, showing only the **PRINTLINE** commands:

```
PRINTLINE POSITION MARGIN TOP ;
  FIELD START 1 LENGTH 4 ;
PRINTLINE POSITION 2 IN 4 IN ;
```

```
FIELD START 7 LENGTH 4
DIRECTION UP ;
```

As expected in field processing, **FIELD** commands are nested within **PRINTLINE** commands. The next figure shows a simplified portion of an unformatted file and two pages of the printout formatted by the page definition, part of which is shown in the command stream. Two printlines are specified because the data file contains two input record formats (1 and 3 are alike; 2 and 4 are alike) and because the fields are mapped to two different positions in the output. The assumption of this sample is that the data file is actually much longer than the portion shown. If, however, the records in the file alternate in format as the first four do, the two **PRINTLINE**s of this page definition formats as many records as are presented, two to a page, on pages 1 through n .

If more than two record mappings are required by the print job, more than two **PRINTLINE** commands are required in the page definition.

Field Direction

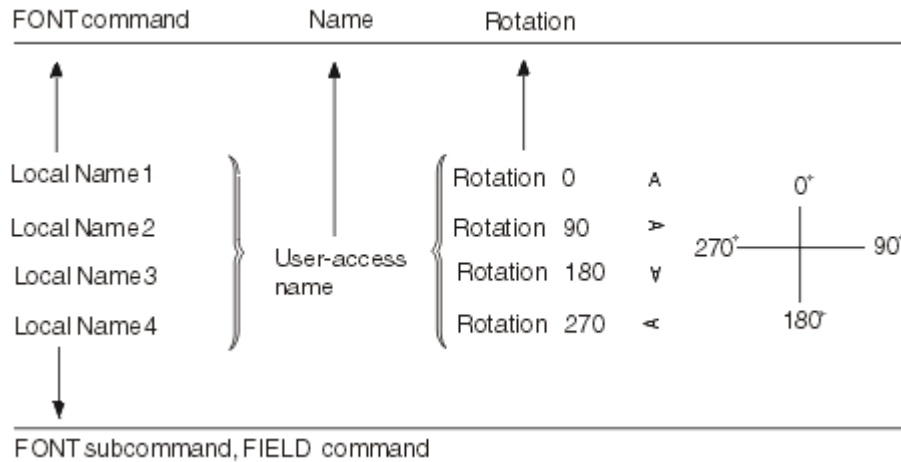

Rotating Fonts

Fonts rotate relative to the inline direction of lines (or fields).

This example focuses on a single letter A from FONTA. With PPFA, a single font specified in a page definition can produce letters in any of four rotations. This is accomplished by a **FONT** command that specifies rotation. If, as in this example, you want to vary the rotation of a font twice within a page, you use two **FONT** commands, one for each rotation. You also use two **PRINTLINE** commands to map the data to the printout, using the two rotations of the font. In a field processing application, **FIELD** commands can be used in the same way. These **PRINTLINE** commands name the rotated font in a **FONT** subcommand.

Figure [Character Rotation, p. 57](#) breaks down the elements required for the **FONT** commands and subcommands. Distinct local names and rotation specifications for each font are placed in a **FONT** command. These identify a font as rotated within a page definition. The rotation of a character is relative to the inline direction of a printline or field. The characters and rotations shown here assume an inline direction of **ACROSS**. See [PPFA Basic Terms, p. 16](#).

Character Rotation

You can use up to 16 possible combinations of logical page direction and font rotation for page printers other than the 3800.

The **FONT** subcommands within **PRINTLINE** or **FIELD** commands that name the rotated font in that page definition use only the local name. The following command stream shows the proper specification and nesting of **FONT** commands and subcommands for rotation.

```
PAGEDEF ABCD ;
  FONT FONTA M103 ;           /*NO ROTATION, LOCAL AND      */
                               /*USER-ACCESS NAMES.         */
  FONT FONTARTD180 M103      /*ROTATED FONT, LOCAL, USER-ACCESS*/
    ROTATION 180 ;           /*NAMES PLUS ROTATION SUBCOMMAND */
                               /*AND PARAMETER.             */
  PRINTLINE FONT FONTA       /*LOCAL NAME                  */
    REPEAT 3 ;
  PRINTLINE FONT FONTARTD180 /*LOCAL NAME                  */
    REPEAT 2 ;
```

Example of Assumed Data File and Rotation Specifications

FONTA, identified in the first **FONT** command, requires no rotation parameter because it is printed in the default position (or 0° rotation) for font M103. For the rotated font, the second **FONT** command identifies FONTARTD180 (the local name) as M103 rotated 180°.

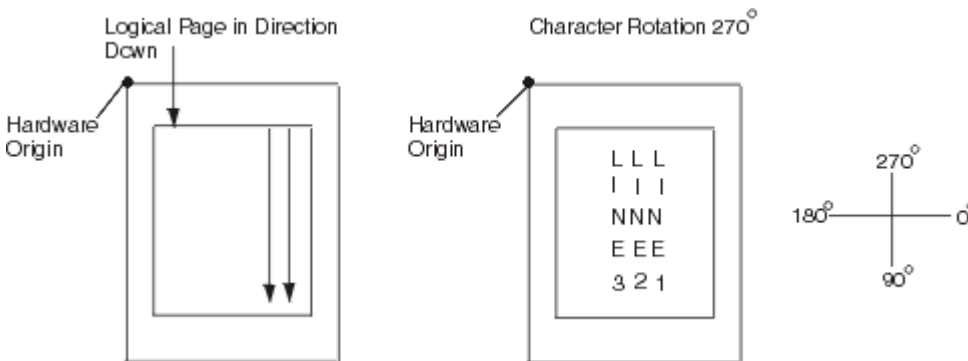

Using Traditional Kanji Formatting

Traditional kanji print presentation, called *tate*, is possible with your print server printers, using a combination of font rotation and logical page direction. A logical page in the **DOWN** direction and a 270° font rotation provide the right combination to present kanji in tate format on the printer.

```
FORMDEF TATE
  OFFSET 1 IN 1 IN ;
PAGEDEF TATE
  HEIGHT 5 IN
  WIDTH 6 IN
  DIRECTION DOWN ;
FONT KANJIRTD M104
  ROTATION 270 ;
PRINTLINE FONT KANJIRTD
  REPEAT 3 ;
```

Figure [AFP Printer Tate Presentation, p. 58](#) shows the result of formatting with the above page definition. The characters are added to lines down the page. Lines are added right to left.

AFP Printer Tate Presentation

Printing Multiple-Up Pages

Multiple up is a printer's term for printing two or more pages of data on one side of a sheet, which is possible with your print server printers and PPFA formatting. The steps used in this example are:

1. Change the print direction of the logical page to one of the landscape presentations.
2. Conceptually divide the sheet of paper into parts, one for each multiple-up page (subpage).
3. Create a **PRINTLINE** position at the top of each multiple-up page.

This example assumes the existence of a line-data file with carriage control 1 characters after records 4, 7, and 11. Each carriage control 1 character begins a new page. Because there are really four pages on the sheet, a skip-to-channel 1 must be used four times. The fifth channel 1 character causes a page eject and the beginning of a new physical sheet. The PPFA commands that follow are for one version of a multiple-up page. This set of commands creates a page layout like the one shown in Figure [Multiple-Up Page Layout, p. 59](#) (the physical sheet is not shown).

```
FORMDEF MULTUP
  OFFSET 1 IN .5 IN ;
```

```

SETUNITS LINESP 4 LPI ;
PAGEDEF MULTUP1
  WIDTH 10 IN
  HEIGHT 8 IN
  DIRECTION DOWN ;          /*FOR LANDSCAPE PRESENTATION */
PRINTLINE CHANNEL 1          /*PAGE 1 */
  POSITION 1 IN 1.5 IN
  REPEAT 6 ;
  ENDSUBPAGE ;
PRINTLINE CHANNEL 1          /*PAGE 2 */
  POSITION 1 IN 5.5 IN
  REPEAT 6 ;
  ENDSUBPAGE ;
PRINTLINE CHANNEL 1          /*PAGE 3 */
  POSITION 6 IN 1.5 IN
  REPEAT 6 ;
  ENDSUBPAGE ;
PRINTLINE CHANNEL 1          /*PAGE 4 */
  POSITION 6 IN 5.5 IN
  REPEAT 6 ;

```

Multiple-Up Page Layout

The **DOWN PRINTLINE** direction creates a page with a landscape presentation typical of multiple-up printing. Individual **PRINTLINEs** are specified for the initial lines of the four pages. Ensure that the lines of each page fit in the space designated by the use of a small font.

Note

In this example, no font is specified for the page definition; therefore, the default font for the page printer is used. If you want a different font, write a **FONT** command naming it.

The next set of commands alters the sequence of pages.

```

FORMDEF MULTUP
  OFFSET 1 IN .5 IN ;
SETUNITS LINESP 4 LPI ;
PAGEDEF MULTUP2
  WIDTH 10 IN

```

```

      HEIGHT 8 IN
      DIRECTION DOWN ;
PRINTLINE CHANNEL 1          /* PAGE 1 */
      POSITION 1 IN 1.5 IN
      REPEAT 4 ;
      ENDSUBPAGE ;
PRINTLINE CHANNEL 1          /* PAGE 2 */
      POSITION 6 IN 1.5 IN
      REPEAT 4 ;
      ENDSUBPAGE ;
PRINTLINE CHANNEL 1          /* PAGE 3 */
      POSITION 1 IN 5.5 IN
      REPEAT 4 ;
      ENDSUBPAGE ;
PRINTLINE CHANNEL 1          /* PAGE 4 */
      POSITION 6 IN 5.5 IN
      REPEAT 4 ;

```

Here, the upper-right and lower-left pages have been reversed by reversing the position controls for the second and third printlines.

The next figure shows the changed printout resulting from the page definition command changes. Once you have set up your basic page definition, changes such as this become easy.

Multiple-Up Page Layout after Page Definition Modification

Note

The **ENDSUBPAGE** command can be used to mark the boundaries between subpages. Without it, the page definition is no different from any other sequence of **PRINTLINE**s with **POSITION** commands. Boundaries do not have to be marked unless conditional processing is being performed. The examples given here print identically with and without **ENDSUBPAGE** commands. (See [Subpage Description and Processing](#), p. 124 for more information.)

Using Page Definition Commands for Record Format Line Data and XML Data

Record Formatting Function

The *record formatting function* allows an application to specify a format identifier (Record ID) with each set of output data fields (Data Record). The format identifier references a specific layout format in a page definition (**PAGEDEF**). At print time, each layout format (referenced by a Record ID in a Data Record) is retrieved from the **PAGEDEF** and used to position and format the associated Data Records/fields on the output page.

The purpose of the record formatting capabilities is to move more of the output formatting function into the **PAGEDEF** and allow for greater flexibility in creating and changing output pages without changing the base application. Rather than the application generating page headers, page trailers and group headers for each page (and thereby fixing the page endings), the page headers, page trailers and group headers can be generated by a **PAGEDEF** layout, allowing the page endings to change as font sizes or data layouts change.

In order to visualize how the record formatting function can be used, review the first six pages of [Record Formatting Examples, p. 83](#). These examples show the output of an application before and after it is formatted with **PAGEDEF** using the record formatting functions.

These functions are provided by several PPFA commands (**LAYOUT**, **DEFINE COLOR**, **DRAWGRAPHIC**, and **ENDGRAPHIC**), and modifications to the **PAGEDEF**, **PAGEFORMAT**, **FONT**, **CONDITION**, and **FIELD** commands. This chapter provides an explanation of the record formatting functions with examples of their use. For details on the syntax of these commands, see [Page Definition Command Reference , p. 269](#).

Some of the functions that can be accomplished in a layout format with the record formatting commands include:

- Selecting different formatting for different types of Data Records/fields based on the Record ID. The output formatting can change mid-page independent of where the output occurs on a page.
- Defining page headers and trailers to be automatically printed on subsequent pages. The headers and trailers can incorporate data from the associated Data Record.
- Numbering the output pages.
- Inserting automatic page ejects when text reaches the bottom margin.
- Creating group headings to be printed at the beginning of a group of data. For example, you can create group headings (including column headings) to be repeated each time a different account type is formatted on a banking statement. An active group heading is automatically repeated on subsequent pages until the data group ends.
- Forcing page ejects to occur in the output.
- Creating boxes with or without black and white or color shading. A set of boxes for a table can be started in a group header and automatically ended and restarted on subsequent pages until the table completes.
- Creating graphical objects such as circles, ellipses, lines, graphs, and so forth in color or black and white output.

- Formatting database records created with field delimiters (rather than fixed length fields).
- Aligning field output to the left or right.

Record Format Page Definition

A *record format page definition* specifies how you want data positioned on the logical page.

A record format page definition is a resource used by the print server that defines the rules of transforming line data and unformatted ASCII into composed pages and text controls for printing. With record format page definitions, you can perform the tasks listed in the next table.

Record Format Page Definition Tasks

Tasks	Location of Example
Creating a page definition	Page Definition Command Nesting, p. 63
Record ID	Record ID Data Format, p. 64
Layout Command	LAYOUT Command, p. 64
Body Records	Body Records, p. 65
Fields	FIELD Command, p. 66
Defining logical page size	Defining Logical Page Size, p. 70
Positioning data on a logical page	Positioning the Data, p. 71
Changing the print direction	Changing Logical Page Print Direction, p. 71
Processing fields	Processing Fields, p. 75
Printing in different directions	Printing Lines in Two Directions on a Page, p. 78
Printing fields in two directions	Printing Fields in Two Directions on the Same Page, p. 78
Changing fonts	Varying Fonts on a Page, p. 79
Rotating fonts	Rotating Fonts, p. 81
Printing kanji	Using Traditional Kanji Formatting, p. 83
Example formats and commands	Record Formatting Examples, p. 83

Page Formats within Page Definitions

Just as form definitions can include more than one copy group, page definitions can include several *page formats*. Page formats use basically the same subcommands as page definitions, and if a subcommand is specified in a page format, it overrides the value specified in the page definition for the page format. A single page definition may contain multiple page formats. If pages in a file are to be

formatted differently, specify more than one page format in your page definition. Within a page definition, page formats are generated in the order in which they are specified.

Using more than one page format to control different pages requires one of the following:

- Adding the Invoke Data Map structured field to the data file each time you want to change page formats.
- Using conditional processing.

Refer to *Advanced Function Presentation: Programming Guide and Line Data Reference* for more information about the Invoke Data Map structured field.

Page Definition Command Nesting

The following simplified command stream shows the proper nesting of commands and the order in which they must be entered when you create a page definition:

```
[SETUNITS]
PAGEDEF
FONT
[OBJECT]
[DEFINE COLOR]
[PAGEFORMAT]
  [SEGMENT]
  [OVERLAY]
  [LAYOUT]
    [CONDITION]
    [FIELD]
    [DRAWGRAPHIC]
    [ENDGRAPHIC]
[PAGEFORMAT]
  [SEGMENT]
  [OVERLAY]
  [LAYOUT]
    [CONDITION]
    [FIELD]
    [DRAWGRAPHIC]
    [ENDGRAPHIC]
```

Note

1. Brackets enclosing a command mean the command is optional.
2. Indentations are used to improve readability.
3. Complete definitions of all commands are included in [Page Definition Command Reference](#), p. 269.

Command Nesting Rules

1. Record format **LAYOUT** commands and traditional **PRINTLINE** commands cannot be used within the same **PAGEDEF**. At least one **LAYOUT** command is required per page format for a record formatting page definition.
2. A **SETUNITS** command can be placed before any other PPFA command. The values set are in effect until the next **SETUNITS** command.

3. **SEGMENT** and **OVERLAY** commands must be specified under their associated **PAGEFORMAT** command.
4. The first **PAGEFORMAT** command can be omitted in a page definition, if the page definition contains only one page format. If the **PAGEFORMAT** command is omitted, the **PAGEDEF** command parameters are used to define the page format.
5. One file can contain multiple sets of page definitions.

Record ID Data Format

In order to allow different formats for different groups (or tables) of data, each of which have an unpredictable number of entries, a Record ID is assigned to each output record to identify the type of record and control layout formatting. An application can group data fields that are to be formatted together as an entity into Data Records with a specific Record ID. For example, in a bank statement, the data fields for a check transaction might be grouped together with a Record ID identifying that record as a check transaction. The **PAGEDEF** would then define a special layout format for a check transaction with a matching Record ID (see [Record Formatting Examples, p. 83](#) for detailed examples).

Record formatting in PPFA is achieved by identifying each input record in the data file with a 10-byte ID, similar to an expanded carriage control (CC) (see [Basic Controls in Record Format Line Data, p. 20](#) for additional information). Each record in the data file must contain a Record ID if record formatting is used. The Record ID must be the first 10 bytes in **every** print record in the data file.

Even though the Record ID is specified as a character string, the Record ID is treated as a hexadecimal string, not a character string. This means there is no translation from ASCII to EBCDIC or vice versa when the Record ID is processed. The Record ID in the input data must match exactly the string specified for the **LAYOUT** Record ID in the page definition in order for correct processing to occur.

When a record is read from the data file at print time, the print server uses the 10-byte Record ID to determine which **LAYOUT** command in the page definition should be used to format the record.

TRCs (Table Reference Characters) cannot be used with record format data. If you have TRCs in the data and tell the print server that TRCs are present at print time, the print server uses the TRC byte as the first byte of the Record ID, and the Record ID is not recognized as such.

Data files can contain both carriage controls and Record IDs. If your data file is mixed mode (line data plus MO:DCA structured fields), then you **must** have a CC byte in the data. The CC byte is not counted as part of the 10-byte Record ID. If your file is plain line data, then CCs are allowed but not required. (See [Basic Controls in Record Format Line Data, p. 20](#) for additional information.)

LAYOUT Command

When record formatting, the **LAYOUT** command is used instead of traditional **PRINTLINE** commands in the page definition. You cannot mix record format **LAYOUT** and traditional **PRINTLINE** commands in the page definition. With **LAYOUT** (see [LAYOUT Command \(Record Format\), p. 352](#)), you can identify four types of Data Records:

- Body Records
- Page Headers

- Page Trailers
- Group Headers

Each of the record types is discussed in the following sections. No matter which type of record you are formatting, you can control the positioning, font, color, and direction for the print record.

The **POSITION** keyword on the **LAYOUT** command is used to set the initial print position for subsequent text and graphics placed with the **FIELD** and **DRAWGRAPHIC** commands.

- The **horizontal position** can be specified as **LEFTMARGIN**, at the same position as the previous layout, or at an absolute or relative location given in inches, millimeters, centimeters, points, or pels (see [PAGEDEF Command, p. 389](#)).
- The **vertical position** can be specified as **TOPMARGIN**, at the same position as the previous layout, at the next vertical position (using current **LINESP** value), or at an absolute or relative location given in inches, millimeters, centimeters, points, or pels (see [PAGEDEF Command, p. 389](#)).

Body Records

The BODY layout type is used for the majority of data in the user's input file. That is, any record that is not used for special processing as a page header, page trailer, or group header, contains data to be formatted and placed on the page.

Body records are positioned initially with the **LAYOUT** command. The default x (horizontal) position for each body record is to be at the same horizontal position as the previous **LAYOUT**. If this is the first **LAYOUT** on a logical page, the default horizontal position is 0.

The default y (vertical) position is to place the layout record down one line (as defined in the **LINESP** subcommand of the last **SETUNITS** command) from the previous field. If this is the first **LAYOUT** on a logical page, the default vertical position is one line down from the top margin of the logical page. See [PAGEDEF Command, p. 389](#) for details about margins.

You can specify the rotation of data with the **DIRECTION** keyword on **LAYOUT**. All of the fields defined for this record layout uses the same direction unless it is overridden on the **FIELD** command. On relative **LAYOUT**s and their fields, the rotation must be **ACROSS**, so that they have the same net rotation as the page format.

You can also specify fonts and color to be used for the text formatted with this layout record. Double-byte fonts can additionally be requested if you have double byte characters in your data. The color of the text and graphic borders is specified with the **COLOR** keyword. See [DEFINE COLOR Command, p. 279](#) and [FONT Command, p. 347](#) for details.

Page segments, overlays and objects can be included with keywords on the **LAYOUT** command. This processing is the same as the traditional **PRINTLINE** command.

Body records can also be identified as belonging to a group. When the **GROUP** keyword is used on the body **LAYOUT**, the group header that is in effect at the time is repeated on subsequent pages as long as the input records use Record ID's that select body **LAYOUT** and use the **GROUP** keyword. The group is ended as soon as a Record ID in the input selects a **LAYOUT** that does not use the **GROUP** keyword.

Page Headers and Trailers

Page headers and trailers are printed automatically on each new page. Default headers and trailers can be created, which are automatically invoked on each new page without requiring or allowing any input data. No input record data is allowed in a default header or trailer because they are triggered automatically by page ejects and are not associated with any records in the input data file. See [LAYOUT Command \(Record Format\)](#), p. 352 for additional details.

Rather than using the defaults, you can create headers and trailers that are invoked by a Data Record containing the header or trailer Record ID. These headers and trailers can use input record data in their layout; however, it is not required.

The following example creates a page header and trailer. See [PAGEDEF Command](#), p. 389 for additional details.

Sample Page Header and Trailer

```
LAYOUT C'statmid'
  SEGMENT ibmlog 1.15 in 1.35 in
  PAGEHEADER NEWPAGE
  POSITION SAME ABSOLUTE NEXT;

LAYOUT C'pgenum' PAGETRAILER
  POSITION SAME ABSOLUTE 10.7 in;
```

Group Headers

A Group Header layout consists of text, graphics, and other data that is to be printed at the beginning of a group of user records. For example, if you are creating a banking statement, you might define a Group Header for checking, one for savings, and so forth.

The group header is defined with a special **LAYOUT GRPHEADER** command, and stays in effect until a **BODY** layout is encountered that specifies **NOGROUP**. See [LAYOUT Command \(Record Format\)](#), p. 352 for additional details on the **GRPHEADER** subcommand.

If a logical page eject occurs before the group is ended, the header is printed after the top margin on each new page until the group ends.

FIELD Command

The **FIELD** command is used to identify a field in a Data Record to be formatted and placed on the page. **FIELD** must follow the **LAYOUT** command, and parameters that are not specified on **FIELD** are inherited from the previous **LAYOUT**. This section describes the new keywords on **FIELD** that are used with record formatting.

Page numbering can be accomplished by specifying **FIELD** with the **PAGENUM** parameter. Most often, you specify **FIELD PAGENUM** with other formatting information such as position and alignment, which causes the current page number to print at the specified position. The current page number is calculated based on the specification of the **PAGECOUNT** parameter on the previous **PAGEDEF** or **PAGEFORMAT** command. You can override the page number to a specific value using the **RESET** parameter on the **FIELD** command. For details, see [Page Numbering](#), p. 68.

You can retrieve the value of the Record ID for printing using the **RECID** keyword on **FIELD**. **RECID** also has **START** and **LENGTH** subparameters to allow only portions of the Record ID to be printed. Normally, you only use the **RECID** parameter for debugging your application by tracing which Record IDs are being processed, although it can be used for anything that makes sense for your application.

You can also specify the **POSITION**, **COLOR**, **DIRECTION**, and **ALIGN** keywords with the **PAGENUM** or **RECID** parameters on **FIELD**. The **BARCODE** and **SUPPRESSION** keywords are not allowed with **PAGENUM** or **RECID**, but can be used with other text fields from the Data Record.

ALIGN is a keyword that is allowed with the **START/LENGTH** or **TEXT** forms of the **FIELD** command, but only if you are doing record formatting. **ALIGN** lets you specify whether the field text should be **LEFT** or **RIGHT** aligned at the given horizontal position.

If your Data Records are stored in a database, the fields may be separated with "field delimiters" instead of just being positional within the record. The **DELIMITER** keyword on the preceding **LAYOUT** command is used to specify the one- or two-byte value that is used to separate fields in the Data Records.

If your data uses field delimiters, you can also specify the **FLDNUM** parameter on the **FIELD** command to indicate the number of the field within the record to be extracted, rather than the **START** position. Fields are numbered from left to right beginning with "1". You can also use the starting position (**START**) and **LENGTH** keywords with the **FLDNUM** to indicate that only part of the field is to be formatted. An example of a typical command is:

Sample Commands and Data With Delimiters

COMMANDS

```

:
LAYOUT 'abc' DELIMITER '*';
FIELD FLDNUM 1 START 2 LENGTH 8 ALIGN RIGHT
  POSITION 5.6 in CURRENT
  FONT varb ; /* Variable text - Amount */
FIELD FLDNUM 2 ALIGN LEFT
  POSITION 1.1 in .9 in
  FONT varb ; /*variable - customer name */

```

DATA

```
abc      *Here is some data*more data*
```

FIELDS used

```
1st field 'ere is s'
2nd field 'more data'
```

Controlling Page Formatting

Parameters on the **PAGEDEF** and **PAGEFORMAT** commands let you specify the margins of the page. The **TOPMARGIN** and **BOTMARGIN** keywords are used to reserve space at the top and bottom of the page. The page headers and trailers are normally placed into this reserved space.

Note

No other text or objects should be written into the margins - only page header and trailer data.

The bottom margin is also used for two other purposes:

- a **BODY** or **GRPHEADER** Data Record that would cause the baseline position to move into the bottom margin area causes a logical page eject
- any graphic that has been started with the **DRAWGRAPHIC** command, but not explicitly ended, automatically ends at print time before it extends into the bottom margin area.

You can force a new logical page in the output with the **NEWPAGE** keyword on a **LAYOUT** command (see [LAYOUT Command \(Record Format\)](#), p. 352). When an input record is encountered whose Record ID matches that **LAYOUT** name, a page eject is completed before the record data is processed. If this is a header or trailer layout, the page eject is performed before the header or trailer becomes active.

The **ENDSPACE** keyword can also be used to control where page ejects are performed. If **ENDSPACE** is coded on a **LAYOUT**, and a Data Record with the matching Record ID is encountered, a page eject is performed before the data is processed - if the remaining space on the page (before the bottom margin) is less than the **ENDSPACE** value.

The **ENDSPACE** keyword can be used to ensure that a Table Heading (Group Heading) does not print at the end of a page without allowing space for additional Data Records (body records), or to ensure that a table entry does not print at the bottom of a page without allowing space for a totals record.

The following example shows the use of page margins and the **NEWPAGE** and **ENDSPACE** keywords:

Sample Page Formatting

```
PAGEFORMAT chub1 TOPMARGIN 2 in BOTMARGIN 2 in;
/*****
/** statmid BODY **/
/*****
LAYOUT C'statmid' PAGEHEADER NEWPAGE ENDSPACE .5 in
POSITION .6 in ABSOLUTE .55 in;
FIELD TEXT C'Big Brother Bank' ALIGN LEFT
FONT comp ; /* default to LAYOUT positioning */
```

Page Numbering

Page numbers can be placed with the **PAGENUM** keywords on the **FIELD** command. **PAGENUM** lets you specify whether the page number should print or not, and whether you want it reset to a specific value rather than using the current value (page count).

The page number prints as an integer (for example, 1, 2, 3, ...) and has a valid range of 1 to four billion (four unsigned bytes of data). If the specified or defaulted font used for printing the page number is other than an EBCDIC font, you must specify it using the **TYPE** subcommand on the **FONT** command.

The page number prints using the font specified on the **FIELD** command. You can also select a **POSITION**, **COLOR**, and **DIRECTION** for the page number using existing **FIELD** keywords.

The **ALIGN** parameter on **FIELD** can also be used to specify whether you want the page number **LEFT** or **RIGHT** aligned at the given position.

The **PAGECOUNT** keyword is allowed with the **PAGEDEF** and **PAGEFORMAT** commands that allows you to specify how page numbering is to be handled when switching between page formats. Page numbering can be stopped, reset, resumed for a certain point or continued from a certain point. For a detailed description on how to specify these options, see [PAGEDEF Command](#), p. 389.

Graphical Objects

When creating output with record formatting, you can use the **DRAWGRAPHIC** commands to create boxes, lines, circles, and ellipses relative to the data printed with the **LAYOUT** command.

DRAWGRAPHIC can be used with **DEFINE COLOR** to shade an object with a percentage of black or other colors, however **DRAWGRAPHIC** is not allowed if you are formatting with the traditional **PRINTLINE**.

Conditional Processing Considerations

Conditional processing works much the same in record formatting as when using the traditional **PRINTLINE** processing. The only difference is the ability to process based upon a field that is defined by delimiters instead of just a fixed start position and length.

Logical Page Eject Processing

A logical page eject can be caused by the following:

- Any Record ID that references a layout format with a specification of New Page.
- A relative baseline overflow (a Body or Group Header layout format that when processed against the current input record causes an overflow of the current print position into the bottom margin). If processing of the input record would cause a relative baseline overflow, the page eject is processed before any part of the input record is printed.
- A Data Map change or Medium Map change, or, in Mixed Mode, a Begin Document or Begin Page structured field.

Page Header, Page Trailer, and Group Header Data Records used with page ejects are activated in the following manner:

- If a Data Record specifies the Record ID of a **PAGEDEF** Page Header layout format, that Data Record is not printed on receipt but is saved as the active page header record (for that **PAGEFORMAT**). It is saved for the duration of the job or until a subsequent Data Record specifies a Page Header (for that **PAGEFORMAT**).
- If a Data Record specifies the Record ID of a **PAGEDEF** Page Trailer layout format, that Data Record is not printed on receipt but is saved as the active page trailer record (for that **PAGEFORMAT**). It is saved for the duration of the job or until a subsequent Data Record specifies a Page Trailer (for that **PAGEFORMAT**).
- If a Data Record specifies the Record ID of a **PAGEDEF** Group Header layout format, that Data Record is not printed on receipt but is saved as the active group header record. The **PAGEDEF** Group Header is printed when the next Data Record specifies a Body layout with a **GROUP** specification and on subsequent page ejects. The Group Header and its associated Data Record is kept active until a subsequent Data Record specifies a Body layout with a **NOGROUP** specification.

When a logical page eject occurs, the following actions are taken in the following order:

- For the current page:

1. If this is the start of a line data document (no previous page ejects, group header records or body records have been processed with this **PAGEDEF**), current page items 1 through 3 are skipped.
 2. If an active page header record was in effect prior to this layout format, that record is presented on the current page using the matching layout. Otherwise, if the active **PAGEFORMAT** contains a default Page Header layout, that layout is used to present a page header.
 3. If an active page trailer record was in effect prior to this layout format, that record is presented on the current page using the matching layout. Otherwise, if the active **PAGEFORMAT** contains a default Page Trailer layout, that layout is used to present a page trailer.
- For the new page:
 1. The current print position is moved to the top of the new page and offset from the top of the new page by the top margin. If the **PAGEFORMAT** is changed, the new Data Map's Margin Definition and layouts are used.
 2. If an active group header record exists for this **PAGEFORMAT**, that record is presented on the new page using the matching Record layout. Note that the group header is not actually printed and causes no action until a Body layout with Group Indicator is processed for the page. If the layout specifies relative positioning, the baseline position of the layout is offset from the top of the page by the top margin plus one line.
 3. If the page eject was caused by a Body layout, the input record causing the page eject is presented on the new page using the layout referenced by the record. If the layout specifies relative positioning and is preceded on the page by a group header, the baseline position is relative to the last printed line of the group header. If the layout specifies relative positioning and is not preceded on the page by a group header, the baseline position of the layout is offset from the top of the page by the top margin plus one line.

Note

The actual locations of "top of page" and "top margin" are affected by the text orientation. See [Using Margins in Record Formatting, p. 73](#) for additional information.

Defining Color Models

Record formatting provides you with the ability to predefine a color with your own name and then use that name anytime this color is needed. It works in much the same way as a **FONT** command where you define the **FONT** with an internal name and then use that name when you place text on the page.

Defining Logical Page Size

[Positioning a Logical Page on a Sheet, p. 27](#) shows how to establish the origin point of a logical page, relative to the media origin on a sheet of paper, using the **OFFSET** subcommand. The following example shows you how to establish the width and height of the logical page relative to this origin point. This example illustrates how the dimensions of a logical page are determined by form definitions and page definitions.

```
SETUNITS 1 IN 1 IN
LINESP 8 LPI;
FORMDEF ABCD
```

```

OFFSET 0 .5;
PAGEDEF ABCD
WIDTH 7.5
HEIGHT 10
DIRECTION ACROSS;
FONT GS12 GS12;
LAYOUT 'abc'
FONT GS12
POSITION 0 TOP;

```

Normally, all parameters consist of a number and a unit of measurement, for example, 6 IN. (See [Units of Measurement](#), p. 207 for information on units that are available.) Numbers can be specified with up to three decimal places. The **LAYOUT** command is included because at least one is required for all page definitions; see [LAYOUT Command \(Record Format\)](#), p. 352 for more information.

Logical Page Dimensions

The **OFFSET** subcommand (0) (.5) in the sample form definition establishes the corner or origin of the logical page relative to the physical sheet. The **WIDTH** and **HEIGHT** subcommands, (7.5) and (10), specify the dimensions of the logical page relative to the logical page origin.

Note

Be careful not to define a logical page larger than the physical sheet. PPFA does not check the size of the physical sheet.

Positioning the Data

The previous section showed you how to define the size of a logical page. The next examples show you how to position data inside the logical page.

Changing Logical Page Print Direction

Logical pages can have four different print directions: **ACROSS**, **DOWN**, **BACK**, and **UP**. This example shows that all four directions can be specified in relation to one offset specification:

```

FORMDEF ABCD
OFFSET (1) (2) ;
PAGEDEF DEFG ;

```

```

FONT GS12 GS12;
PAGEFORMAT DEFG1
WIDTH (3)
HEIGHT (4)
DIRECTION ACROSS ;
LAYOUT 'abc' ;
PAGEFORMAT DEFG2
WIDTH (3)
HEIGHT (4)
DIRECTION DOWN ;
LAYOUT 'def' ;
PAGEFORMAT DEFG3
WIDTH (3)
HEIGHT (4)
DIRECTION BACK ;
LAYOUT 'ghi' ;
PAGEFORMAT DEFG4
WIDTH (3)
HEIGHT (4)
DIRECTION UP ;
LAYOUT 'jki' ;

```

↓ Note

The parenthetical numbers represent dimensions. Figure [Logical Page Dimensions, p. 71](#) shows how these dimensions relate to the logical page.

One page definition is used to simplify the example, yet four logical pages are specified. The **PAGEFORMAT** commands create subsets of page definitions for each logical page.

↓ Note

The page formats in this example require an Invoke Data Map structured field at the place in the data file where you want to change page formats. The **LAYOUT** commands are required but are not relevant in the example.

The **DIRECTION** subcommand with one of its four direction parameters **ACROSS**, **DOWN**, **UP**, or **BACK** specifies the print direction of the logical page.

Figure [Logical Page Print Directions in Relation to Origin, p. 73](#) shows the format of each of the logical pages specified in the page definition with the direction specification of each. The pages with the **ACROSS** and **BACK** directions are in portrait presentation. The pages with the **DOWN** and **UP** directions are in landscape presentation.

Logical Page Print Directions in Relation to Origin

The media origins and logical page origins do not change with the presentation of the data on the page. The **OFFSET** subcommand of the form definition need not change. However, the width and height dimensions do change; that is, the **WIDTH** subcommand always governs the horizontal (inline) dimension as you view the page, and the **HEIGHT** subcommand always governs the vertical (baseline) dimension whether the page is in portrait or in landscape presentation. Ensure that these specifications do not cause the logical page to cross the edge of the physical page.

However, if the **DOWN** direction is specified for use with a continuous forms printer, the **PRESENT** and **DIRECTION** subcommands may need to be specified in the form definition. See [Specifying Page Presentation on Continuous-Forms Printers, p. 36](#) for more information.

Using Margins in Record Formatting

Margins follow the inline direction of the page. For example, if the text orientation is **ACROSS**, the top-left diagram in Figure [Relationship of Margin Definition to Text Orientation, p. 75](#) shows the left, top, right, and bottom margins, respectively. Once specified, these margins define a bounding box for the **PAGEFORMAT** as indicated by the dotted lines.

Note that if the text orientation is changed, the same bounding box applies to the new orientation, but the name of the margins change in the new orientation. For example, if the new text orientation is

DOWN, as shown in the top-right diagram of this same figure, the top margin in the new orientation is now defined on the long side of the page, and so on.

Left Margin

Specifies the offset of the left margin along the i axis from the left edge of the page. The left edge of the page is the zero position on the i axis.

Top Margin

Specifies the offset of the top margin along the b axis from the top edge of the page. The top edge of the page is the zero position on the b axis.

Right Margin

Specifies the offset of the right margin along the i axis from the right edge of the page.

Bottom Margin

Specifies the offset of the bottom margin along the b axis from the bottom edge of the page.

Relationship of Margin Definition to Text Orientation

Processing Fields

This section describes the mapping of individual fields to the printed sheets. The technique allows you to print unformatted data according to precise specifications, and these specifications can change without affecting the data file.

The rule for field processing of data files is: Each **FIELD** command must follow its associated **LAYOUT** command, and more than one **FIELD** command can be specified for a single **LAYOUT** command.

For this field-processing example, the data file shown in the next figure is used. Figure [Data Arranged on the Printed Page, p. 76](#) represents an output format that could be used to place data on a form, such as an invoice or an order. The page definition commands to print Figure [Data Arranged on the Printed Page, p. 76](#) are as follows:

```
PAGEDEF ABCD
    WIDTH 7 IN
    HEIGHT 8 IN ;
FONT GS12 GS12;
LAYOUT 'abc' POSITION 1 IN ABSOLUTE 1 IN ; /*PROCESSING FOR R1 */
    FIELD START 1 LENGTH 4 ; /*THE LAYOUT POSITION IS */
                                /*THE DEFAULT FOR THE FIRST FIELD*/

    FIELD START 11 LENGTH 4
        POSITION 4 IN 0 IN ;
LAYOUT 'def' POSITION 3 IN ABSOLUTE 4 IN ; /*PROCESSING FOR R2 */
    FIELD START 1 LENGTH 4 ; /*DEFAULT POSITION */
    FIELD START 6 LENGTH 4
        POSITION 0 IN 1 IN ;
    FIELD START 13 LENGTH 3
        POSITION 2 IN 3 IN ;
LAYOUT 'ghi' POSITION 1 IN ABSOLUTE 2 IN ; /*PROCESSING FOR R3 */
    FIELD START 1 LENGTH 4 ; /*DEFAULT POSITION */
    FIELD START 11 LENGTH 4
        POSITION 4 IN 0 IN ;
```

Note

The data area of this example does not show the Record ID.

Unformatted Print Data File

	1	2	3	4	5	6	7	8	9	1	2	3	4	5	6	7
R1	A	A	A	A						B	B	B	B			
R2	X	X	X	X	Y	Y	Y	Y		Z	Z	Z	Z			
R3	1	1	1	1						2	2	2	2			

Data File

Data Arranged on the Printed Page

Position Subcommand

The **POSITION** subcommand of each **LAYOUT** command specifies the layout position relative to either the logical page origin or the previous **LAYOUT** position. The **POSITION** subcommands below **FIELD** commands specify a field position relative to the governing **LAYOUT** position.

This is for use in positioning text, objects and graphics. If **RELATIVE** is specified or **POSITION** is not specified, the baseline of the Position is relative to the previous **LAYOUT** position.

1. For **PAGEHEADER LAYOUT** the baseline position can be anywhere on a logical page.
2. For **PAGETRAILER**, **GROUPHEADER**, and **BODY LAYOUT** the baseline position can be anywhere on a logical page and can be specified as **RELATIVE**.

Following **POSITION** subcommands come the horizontal (*x*) then the vertical (*y*) offsets from the reference point.

x

Specifies the horizontal offset from the left side of the logical page.

y

Specifies the vertical offset from the top side of the logical page.

They are parallel in structure to the **OFFSET** subcommand of the form definition.

For example, the final **POSITION** subcommand on the previous example places the final field 1 + 4 inches to the right of the left edge of the logical page, combining the *x* value of 1 in the **LAYOUT** command, and the *x* value of 4 in the nested **FIELD** command. The 0 in the **FIELD** command specifies no change to the *y* value in the **LAYOUT** command. Thus, the position of the final field is 5 IN (*x*), 2 IN (*y*).

Note

The first **FIELD** command within each **LAYOUT** has no position specification, because the **LAYOUT POSITION** value is the default for the first **FIELD** command nested under it.

Alternate controls for the *x* and *y* values of a **POSITION** subcommand are available. See the description of the **POSITION** subcommand in **FIELD** command (Record Format).

FIELD Command as Used in this Example

In the **FIELD** command, the **START** and **LENGTH** parameters specify the location of the field in the record to be processed. **START** indicates the starting byte position, and **LENGTH** specifies the number of bytes in the field.

```
setunits linesp 6 lpi;
PAGEDEF re19 replace yes
  direction across width 8.5 in height 11.0 in;
FONT GS12 GS12;
LAYOUT 'abc' position 0 IN 1.0 IN;

/* The fields will be placed at +120 pels, +24 pels (next) */
/* and +48 pels (.20 IN) from lines previously placed on page */

setunits linesp 10 lpi;
```

```
LAYOUT 'def' position 0 relative next;
FIELD START 1 LENGTH 3 position 0 IN .5 IN;
FIELD START 4 LENGTH 3 position 0 IN next;
FIELD START 7 LENGTH 3 position current .20 IN;
```

Printing Lines in Two Directions on a Page

Lines can be printed in any of four directions, depending on the type of printer being used. Refer to your printer's documentation for the print directions supported by your printer.

The four parameters for line direction are **ACROSS**, **DOWN**, **BACK**, and **UP**. The PPFA commands used to format a line-data file with lines printed in more than one direction (as shown in Figure A Printout with More Than One Line Direction, p. 78) are stated in the following page definition:

```
PAGEDEF ATOG
  DIRECTION ACROSS ;
  FONT GS12 GS12;
  LAYOUT 'abc' POSITION 1 IN ABSOLUTE 1 IN ; /*LINES A-E */
  LAYOUT 'def' POSITION .5 IN ABSOLUTE 6 IN /*LINE F */
  DIRECTION UP ;
  LAYOUT 'ghi' POSITION 1 IN ABSOLUTE 6 IN ; /*LINE G */
```

A Printout with More Than One Line Direction

Note

The data area of this example does not show the Record ID.

In this page definition, the logical page direction **ACROSS** is specified. This is actually the default, but its inclusion clarifies that no direction control is needed for lines A-E. The default direction of a layout is the direction specification of the logical page of which it is part. The **LAYOUT** command for the record F has a **DIRECTION** subcommand because the direction specification changes from that of the previous line. Record G is to be printed in the **ACROSS** direction again. A direction is not specified, however, because the **ACROSS** direction is the default for all lines in this page definition.

Printing Fields in Two Directions on the Same Page

This example is similar to Figure A Printout with More Than One Line Direction, p. 78, except that you learn how to control direction field by field. This method creates a field-processing page definition and places direction controls in the **FIELD** commands. This command stream contains a portion of the page definition controls, showing only the **LAYOUT** commands:

```
LAYOUT 'abc' POSITION LEFTMARGIN TOPMARGIN NEWPAGE;
  FIELD START 1 LENGTH 4 ;
  LAYOUT 'def' POSITION 2 IN ABSOLUTE 4 IN ;
```

```
FIELD START 7 LENGTH 4
DIRECTION UP ;
```

As expected in field processing, **FIELD** commands are nested within **LAYOUT** commands. Figure [Field Direction, p. 79](#) shows a simplified portion of an unformatted file and two pages of the printout formatted by the page definition, part of which is shown in the command stream. Two layouts are specified because the data file contains two input record formats (1 and 3 are alike; 2 and 4 are alike) and because the fields are mapped to two different positions in the output. The assumption of this sample is that the data file is actually much longer than the portion shown. If, however, the records in the file alternate in format as the first four do, the two **LAYOUT**s of this page definition format as many records as are presented, two to a page, on pages 1 through n .

If more than two mappings are required by the print job, more than two **LAYOUT** commands are required in the page definition.

Note

The data area of this example does not show the Record ID.

Field Direction

Varying Fonts on a Page

This example illustrates a simple font variation within a printout. The task is to print a line-data file having the first line of each page in bold-faced type and the rest in standard type. This requires controls for two fonts in the page definition.

The commands to select a single font for the page, as shown in Figure [Data File Printed Using a Single Font, p. 80](#), are as follows:

The **FONT** command contains two names: the local (**STANDARD**) name and the user-access (M101) name for the selected font.

```
PAGEDEF ABCD ;
FONT STANDARD M101;
FONT BOLDFACE M102;
LAYOUT 'abc' FONT BOLDFACE NEWPAGE;
LAYOUT 'def' FONT STANDARD NEWPAGE;
LAYOUT 'ghi' FONT STANDARD;
```

 Note

Fonts cannot be an FGID (Font Typeface Global Identifier). Also, all page definitions require a **LAYOUT** command.

The following example shows line data using a single font:

Line Data for Single Font Example

```
def      Record 1
ghi      Record 2
ghi      Record 3
ghi      Record 4
ghi      Record 5
ghi      Record 6
def      Record 7
ghi      Record 8
ghi      Record 9
def      Record 10
ghi      Record 11
ghi      Record 12
ghi      Record 13
```

Data File Printed Using a Single Font

Record 1 Record 2 Record 3 Record 4 Record 5 Record 6	Record 7 Record 8 Record 9	Record 10 Record 11 Record 12 Record 13
Page 1	Page 2	Page 3

This command stream works on the principle that each line of output whose font you want to change from the font in the previous line must be controlled by a separate **LAYOUT** command. The **FONT** subcommand of the **LAYOUT** command names the font desired for that line. In this example, two **LAYOUT** commands are used because one font change and two fonts are intended for the output. The user-access font names appear in the two **FONT** commands immediately below the **PAGEDEF** command and, optionally, a local name. M101 and M102 in the example are user-access names; **BOLDFACE** is a local name. Use the local name in the **FONT** subcommand of **LAYOUT** if it is included in the corresponding **FONT** command, as is done for the first **LAYOUT** command.

Line Data for Two Font Example

```
abc      Record 1
ghi      Record 2
ghi      Record 3
ghi      Record 4
ghi      Record 5
ghi      Record 6
abc      Record 7
ghi      Record 8
ghi      Record 9
```

```

abc      Record 10
ghi      Record 11
ghi      Record 12
ghi      Record 13

```

Font Change Using FONT Commands and Subcommands

Changing fonts field by field is similar to changing them in layouts. You map each field individually with a **FIELD** command; include a **FONT** subcommand in the **FIELD** command. If a font change is desired for a field, as with the **FONT** subcommand of a **LAYOUT** command, the font must be previously named in a **FONT** command.

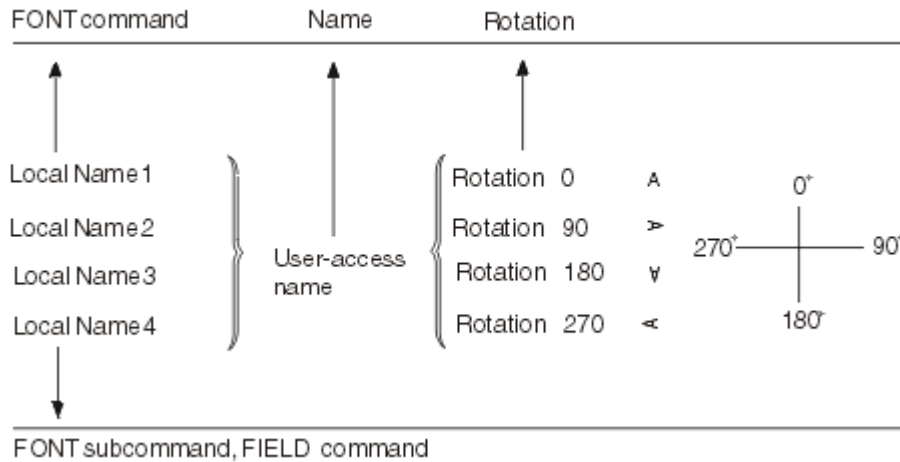

Rotating Fonts

Fonts rotate relative to the inline direction of lines (or fields).

This example focuses on a single letter A from FONTA. With PPFA, a single font specified in a page definition can produce letters in any of four rotations. This is accomplished by a **FONT** command that specifies rotation. If, as in this example, you want to vary the rotation of a font twice within a page, you use two **FONT** commands, one for each rotation. You also use two **LAYOUT** commands to map the data to the printout, using the two rotations of the font. In a field processing application, **FIELD** commands can be used in the same way. These **LAYOUT** commands name the rotated font in a **FONT** subcommand.

The next figure breaks down the elements required for the **FONT** commands and subcommands. Distinct local names and rotation specifications for each font are placed in a **FONT** command. These identify a font as rotated within a page definition. The rotation of a character is relative to the inline direction of a field or **LAYOUT**. The characters and rotations shown here assume an inline direction of **ACROSS**.

Character Rotation

You can use up to 16 possible combinations of logical page direction and font rotation for page printers other than the 3800.

The **FONT** subcommands within **LAYOUT** or **FIELD** commands that name the rotated font in that page definition use only the local name. The following command stream shows the proper specification and nesting of **FONT** commands and subcommands for rotation.

```
PAGEDEF ABCD ;
  FONT FONTA M103 ;           /*NO ROTATION, LOCAL AND      */
                              /*USER-ACCESS NAMES.         */
  FONT FONTARTD180 M103      /*ROTATED FONT, LOCAL, USER-ACCESS*/
    ROTATION 180 ;           /*NAMES PLUS ROTATION SUBCOMMAND */
                              /*AND PARAMETER.             */
  LAYOUT 'abc' FONT FONTA ;   /*LOCAL NAME                  */
  LAYOUT 'def' FONT FONTARTD180 ; /*LOCAL NAME                   */
```

Example of Assumed Data File and Rotation Specifications

FONTA, identified in the first **FONT** command, requires no rotation parameter because it is printed in the default position (or 0° rotation) for font M103. For the rotated font, the second **FONT** command identifies FONTARTD180 (the local name) as M103 rotated 180°.

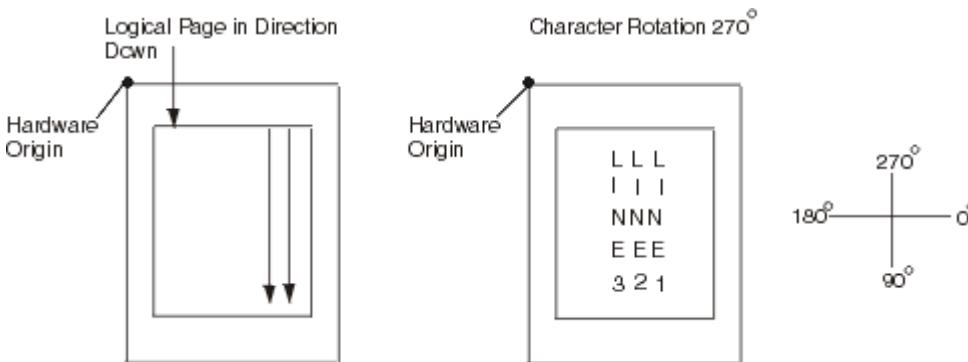

Using Traditional Kanji Formatting

Traditional kanji print presentation, called *tate*, is possible with your print server printers, using a combination of font rotation and logical page direction. A logical page in the **DOWN** direction and a 270° font rotation provide the right combination to present kanji in tate format on a print server printer.

```
FORMDEF TATE
  OFFSET 1 IN 1 IN ;
PAGEDEF TATE
  HEIGHT 5 IN
  WIDTH 6 IN
  DIRECTION DOWN ;
FONT KANJIRTD M104
  ROTATION 270 ;
LAYOUT 'tate' FONT KANJIRTD;
```

Figure [AFP Printer Tate Presentation, p. 83](#) shows the result of formatting with the above page definition. The characters are added to lines down the page. Lines are added right to left.

AFP Printer Tate Presentation

Record Formatting Examples

In order to allow different formats for different groups (or tables) of data, each of which have an unpredictable number of entries, a Record ID is assigned to each output record to identify the type of record and control layout formatting. An application can group data fields that are to be formatted together as an entity into Data Records with a specific Record ID. For example, in a bank statement, the data fields for a check transaction might be grouped together with a Record ID identifying that record as a check transaction. The **PAGEDEF** would then define a special layout format for a check transaction with a matching Record ID.

The same thing could be done for a deposit transaction, customer account information, deposit totals, check totals, etc. If the customer account information is going to be used in a page header on each page, the **PAGEDEF** can define a special layout format for a customer information record that automatically generates a page header for each page.

This section shows two complete examples using the record formatting process. Each is divided into three parts - the desired output (after **PAGEDEF** processing), the application output (before **PAGEDEF** processing), and the PPF commands.

Example 1 Desired Output (after PAGEDEF Processing)

The example user data along with the PPFA commands are meant to create this printed output. (The following page has been resized to fit the format of this book.)

XML Page Definition Formatting Function

The XML page definition formatting function allows an application to specify formatting instructions for XML data by specifying an **XLAYOUT** command with specific formatting instructions for the data. The **XLAYOUT** command addresses an XML data item by specifying a **QTAG** (qualified tag) for that data. A **QTAG** is a series of XML start tags that fully identify the XML data item. For example, in Figure [XML Data Elements, p. 97](#), for your customer's first name, the **QTAG** would be `Customer, name, and first`. To define a local name "first" for easy reference you could use the following **DEFINE** command:

```
DEFINE first QTAG 'Customer','name','first';
```

and reference it with the following **XLAYOUT** command using the defined local name "first":

```
XLAYOUT first POSITION ...;
```

Before printing the data, PSF scans the XML data item and matches it to an **XLAYOUT** command in the page definition by using its **QTAG**. The matching **XLAYOUT** command in the page definition is used to position and format the associated XML data item and its attributes on the printed page.

The XML page definition function has the following new PPFAs concepts:

Relative Inline Positioning:

Relative inline positioning places data relative to the current position. If you position a text field and then place the text, the end of the text becomes the new current position. Graphics, barcodes, objects, segments, and overlays **do not** change the current position after they are originally positioned. For example, if you position a line with a **DRAWGRAPHIC LINE** command, the new current position is the starting point of that line. The length of the graphic line does not change the current position.

There are several restrictions when using relative inline positioning:

1. **XLAYOUT** commands with relative positioning cannot contain any of the following:
 - **FIELD** commands with inline positioning relative to the **XLAYOUT (LPOS)**
 - **FIELD ATTR** (attribute) with inline positioning relative to the **XLAYOUT (LPOS)**
 - **FIELD** commands with barcodes
 - **DRAWGRAPHIC** commands
 - **OBJECT** subcommands
 - **SEGMENT** subcommands
 - **OVERLAY** subcommands
2. You can only use the **SAME** parameter for inline positioning on the **XLAYOUT** command when the previously used **XLAYOUT** command used absolute inline positioning.

Absolute Inline Positioning:

Allows absolute inline positioning on a **FIELD** command for specific placement of elements.

Attributes are Special FIELDS:

The attribute is identified by name and the data printed is from the attribute value or a portion of the attribute value and not from the element content.

↓ Note

1. If a **FIELD** is used for presenting any piece of data on the **XLAYOUT** command, **FIELD** commands must be used for all pieces of data presented on the **XLAYOUT** command. Since an attribute is a special field, if you want to print both an attribute value and the element data you need to code the attribute field for the attribute value and a regular field for the element data.
2. PSF suppresses leading and trailing blanks (X'40' for EBCDIC or X'20' for ASCII) in the data. Multiple embedded blanks are reduced to one blank.

POSITION Subcommand

The **POSITION** subcommand on each **XLAYOUT** command specifies the starting layout position in the printout. The **POSITION** subcommand on the **FIELD** command specifies a field position relative to the governing **XLAYOUT** position.

Relative Baseline Position

The baseline position corresponds to the y-pos position in PPFA and the inline position corresponds to the x-pos position.

If the baseline position is relative, the offset is measured as follows:

- For Page Header, the offset is relative to the top of the page.
- For Page Trailer, it is relative to the last Record processed; if there is none, it is relative to the top margin.
- For Group Header and Body, the offset is relative to the last Group Header or Body processed; if there is none, it is relative to the top margin.
- For Field, it is relative to the last Field or Body that was processed for print (whether or not data is printed).

The inline position is not changed in the case where there is no data to print.

For Example:

```
XLAYOUT text1
  POSITION 6 mm 8 mm;
  FIELD ATTR 'attr1' FONT FONT03;
  FIELD ATTR 'attr2' FONT FONT03 POSITION 20 mm 5 mm;
  FIELD ATTR 'attr3' FONT FONT03;

attr1 = abcdefg
attr2 = W
attr3 = hjkmnp
```

Output:

```
abcdefg
```

```
      Whjkmnp
```

In this case W is positioned at 6+20 mm across and 8+5 mm down and hjkmnp is positioned next to W. Since there is no **POSITION** specified for **FIELD** for attr3, its starting point is the current position after attr2 is printed.

If attr2 has no value:

```
attr1 = abcdefg
attr2 =
attr3 = hjkmnp
```

Output:

```
abcdefg
```

```
      hjkmnp
```

In this case `hjkmp` is positioned next to `abcdefg` but underneath, down 5 mm. Since there is no **POSITION** specified for **FIELD** for `attr3`, its starting point is the current position after `attr2` is printed. When there is no data for `attr2`, the x position does not change from where it ended with `attr1`, but the y position moves down 5 mm.

XML Data Element Example

An application can group XML data elements to be formatted together as an entity by grouping those elements hierarchically under a collection XML data element. The data order normally does not matter in formatting the data elements unless the elements are to be placed relative to each other in the inline direction. Any elements to be placed inline relative to each other must be ordered in inline presentation order. Use the **XLAYOUT/FIELD** commands to place the data on the presentation device. Figure [XML Data Elements, p. 97](#) is an example of a bank customer showing the “name” and “address” fields placed together:

XML Data Elements

```
<Customer>
  <name>
    <title>Dr.</title>
    <first>Kelly</first>
    <last>Green</last>
  </name>
  <address>
    <strno>1911</strno>
    <street>Colt Lane</street>
    <city>Longmont</city>
    <state>CO</state>
    <zip>80501</zip>
  </address>
</Customer>
```

The example in Figure [XML Data Elements, p. 97](#) results in the following printed output:

```
Dr. Kelly Green
1911 Colt Lane
Longmont, CO 80501
```

The page definition used to create the output is as follows:

```
PAGEDEF xmp101 UDTYPE ebcdic REPLACE yes;
/*-----*/
/* Font definitions:
/*-----*/
FONT E21HOC TYPE EBCDIC;

/*-----*/
/* Use QTAG definitions to define short alias names      */
/* that make coding the XLAYOUTs easier. Do the         */
/* messy work here, allowing us to code on the XLAYOUT: */
/* XLAYOUT zip ...                                     */

FIELD TEXT',';
FIELD START 1 LENGTH 2; /*just the abbreviation*/
XLAYOUT zip POSITION RELATIVE 0 RELATIVE 0;
FIELD TEXT'';
FIELD START 1 LENGTH *;

```

In the above example, the XML data items "Dr.", "Kelly", and "Green" are printed relative to each other using *relative inline positioning*. This can only be done because the data appears in the following order: the title, "Dr." is first; the first name, "Kelly" is next; and the last name, "Green" is last. However, if you wanted to use this data, and change the order of the names to print the last name followed by the first name, you **must** position the names using *absolute inline positioning*, because the data cannot be reordered using *relative inline positioning*.

XML Data Format Example

XML allows the same data to be used for multiple presentation media. In Figure [XML Data File, p. 98](#) XML data file is shown formatted for printing with PPFA's XML support.

XML Data File

```

<?xml version="1.0" ?>
<?xml:stylesheet type="text/xsl" href="bbbank.xsl"?>

```

```

Creating Complex Printouts

You are now ready to learn about some formatting tasks that might apply to more complex printouts. The basic form definition and page definition elements have been covered. This chapter describes how these elements are combined to create complete print jobs.

The advanced techniques covered in this section are illustrated in the following examples:

Form Definitions and Page Definition Tasks

Tasks	Location of Example
Field Processing with Overlay	Combining Field Processing and an Electronic Overlay, p. 111
Suppressing Data	Using Suppressions to Vary Data Presentation, p. 113
Including Fixed Text	Incorporating Fixed Text into a Page Definition, p. 114
Combining Two Reports	Combining Two Reports into One Printout, p. 117

The examples in this chapter build on a single sales application, showing different sales reports being formatted by form definitions and page definitions.

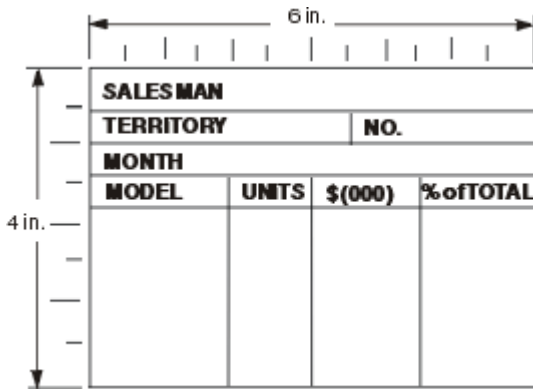

Combining Field Processing and an Electronic Overlay

This example involves printing a monthly individual sales report for a specified distribution. The following items are needed to generate the sales report:

- A pre-designed electronic overlay for the sales report
- An unformatted print data file with periodic sales statistics

An example of these is shown in Figure [Electronic Overlay and Data File for a Sales Report, p. 112](#).

Electronic Overlay and Data File for a Sales Report

Overlay

	1	2	3	4	5	6	7	8	9	1	2	3	4	5	6	7	8	9	1	2	3
R1	J	o	n	n	s	m	i	t	r												
R2	T	e	x	a	s			0	7	7	1	4									
R3	N	e	v																		
R4	S	i	e	r	r			1	2					5	9					6	
R6	O	l	e	r	o			1	6					7	0					1	0
R6	A	g	u	e				6	0					1	0	4				1	5
R7	A	i	l	e	g	r	e		7	1				2	6	5				4	0

Data File

The code example that follows contains a form definition and a page definition. The page definition maps the file to the overlay.

In the previous figure, the 0,0 point is the upper-left corner of the overlay. This means that the logical page origin must coincide with the overlay origin in this example. **POSITION** subcommands are relative to the logical page origin. The overlay origin point that positions the overlay is specified in the Overlay Generation Language/370 that creates the overlay, but can be modified in the page definition. In mapping to an overlay, you should check the input to the overlay creation program so you can coordinate its origin with the logical page origin. You can reposition the overlay through the **PRINTLINE** command.

```

01 FORMDEF SLSRPT OFFSET 0 0 ;
02   OVERLAY SLSRPT ;
03   SUBGROUP OVERLAY SLSRPT ;
04
05 PAGEDEF SLSRPT ;
06   PRINTLINE POSITION 2 IN 1.3 IN ; /* RECORD 1 */
07   FIELD START 1 LENGTH 23 ;
08   PRINTLINE POSITION 2 IN 1.70 IN ; /* RECORD 2 */
09   FIELD START 1 LENGTH 9 ; /* DEFAULT POSITION */
10   FIELD START 10 LENGTH 5
11   POSITION 4.3 IN * ; /* THE ASTERISK MEANS */
12   /* CURRENT LINE */
13   PRINTLINE POSITION 1.5 IN 6 IN ; /* RECORD 3 */
14   FIELD START 1 LENGTH 4 ;
15   SETUNITS LINESP 4 LPI ;
16   PRINTLINE REPEAT 4 /* RECORDS 4-7 */
17   POSITION 1.5 IN 3.6 IN ;
18   FIELD START 1 LENGTH 7 ; /* DEFAULT POSITION */
19   FIELD START 10 LENGTH 3

```

```

20     POSITION 1.5 IN * ;
21  FIELD START 16 LENGTH 3
22     POSITION 2.5 IN * ;
23  FIELD START 21 LENGTH 3
24     POSITION 3.5 IN * ;
    
```

A time-saving device used in the above example is the **REPEAT** subcommand (line 16), which maps a single printrline with its field subsets to records 4 through 7 with all model names and sales statistics. The length values in the repeated fields are 7, 3, 3, and 3: sufficient to accommodate the largest model name, unit value, \$(000), and percentage fields mapped by this **FIELD** command.

The next figure shows the report formatted by the resources generated in the command stream of this example.

Sales Report

SALESMAN		John Smith	
TERRITORY		Texas	NO.07714
MONTH		Nov.	
MODEL	UNITS	\$(000)	% of TOTAL
Sierra	12	59	6
Otero	16	70	10
Agua	60	104	15
Allegre	71	265	40

Using Suppressions to Vary Data Presentation

PPFA and your print server printers enable you to produce variations of the same report in a single job. The essential function for this capability is called *suppression*. Suppression involves the coordinated specification of elements in both the page definition and the form definition. You create a suppression in the page definition and turn it on or off in a subgroup within a form definition.

This example shows how to alter the controls in the previous example ([Combining Field Processing and an Electronic Overlay, p. 111](#)) in order to generate a second report along with the one already created.

First, change the page definition by adding a **SUPPRESSION** subcommand to the third field in the repeated **PRINTLINE**—the **PRINTLINE** that mapped the models and sales figures in [Combining Field Processing and an Electronic Overlay, p. 111](#). The suppression is, in effect, created by the **SUPPRESSION** subcommand in the **FIELD** command. The following example shows the addition at line 23.

```

18  FIELD START 1 LENGTH 7 ;
19  FIELD START 10 LENGTH 3
20     POSITION 1.5 IN * ;
21  FIELD START 16 LENGTH 3
22     POSITION 2.5 IN *
23     SUPPRESSION SALES ;           /*ADDED LINE   */
24  FIELD START 21 LENGTH 3
25     POSITION 3.5 IN * ;
    
```

The **SUPPRESSION** subcommand creates the potential for selective suppression of the data in the “\$(000)” field of the report.

Then, rewrite the form definition, creating two subgroups within the copy group. Next, write a **SUPPRESSION** command immediately after the **FORMDEF** command. Finally, place a **SUPPRESSION** subcommand in the subgroup in which you want the data suppressed. This names the suppression. The resulting form definition command stream is as follows:

```
FORMDEF SECRPT ;
  SUPPRESSION SALES ;                /*NAMING THE SUPPRESSION */
  COPYGROUP SECRPT ;
  OVERLAY SLSRPT ;                  /*NAMING THE OVERLAY */
  SUBGROUP COPIES 1
    OVERLAY SLSRPT ;
  SUBGROUP COPIES 1
    OVERLAY SLSRPT
    SUPPRESSION SALES ; /*TURNING ON THE SUPPRESSION */
```

The result is shown in Figure [Selective Suppression, p. 114](#). The second subgroup creates the second output page of the same data with a second set of modifications; in this case, *modifications* means a suppression that is not in the first subgroup.

Selective Suppression

SALESMAN John Smith			
TERRITORY Texas		NO. 07714	
MONTH Nov.			
MODEL	UNITS	\$(000)	%ofTOTAL
Sierra	12	59	6
Otero	16	70	10
Agua	60	104	15
Allegre	71	265	40

Subgroup1

SALESMAN John Smith			
TERRITORY Texas		NO. 07714	
MONTH Nov.			
MODEL	UNITS	\$(000)	%ofTOTAL
Sierra	12		6
Otero	16		10
Agua	60		15
Allegre	71		40

Subgroup2

Suppressed Fields

Review the steps in this example. To suppress a field, identify the field as *suppressible* in the page definition under the **FIELD** command in question. Then create a subgroup, activating this suppression with a **SUPPRESSION** subcommand in the form definition.

The first subgroup produces an output identical to the report in [Combining Field Processing and an Electronic Overlay, p. 111](#). It contains no suppression.

Note

This example can only be printed simplex.

Incorporating Fixed Text into a Page Definition

Fixed text can be incorporated into an electronic overlay through the use of programs, such as Overlay Generation Language/370. Having another place (the page definition) to incorporate fixed text permits you to format documents more efficiently.

In [Combining Field Processing and an Electronic Overlay, p. 111](#), a territory sales report for salesman John Smith is created. Here, the territory sales report is incorporated into a larger format going to ACME's corporate headquarters in Chicago. Therefore, the identification for the region needs to appear on the report form. An overlay is used as a header for the composite report. This means that two overlays appear in the command stream: one carries over from [Combining Field Processing and an Electronic Overlay, p. 111](#) and the other is the header.

So, as shown in Figure [Input for the Corporate Version of an Individual Sales Report, p. 115](#), three fixed inputs generate the final report: overlay SLSRPT, overlay HDR, and the fixed regional identification text. (It is the second item that is worked into the page definition in this example.)

Input for the Corporate Version of an Individual Sales Report

SALESMAN			
TERRITORY		NO.	
MONTH			
MODEL	UNITS	\$(000)	% of TOTAL

Overlay SLSRPT

INDIVIDUAL SALES REPORT ACME CORP. - CHICAGO
Regional Mgrs. Submit First Monday in Each Month

Overlay HDR

Southwest Region Jim Jones - Manager

Fixed Text

The data file used to generate this report is the same as the one shown in Figure [Electronic Overlay and Data File for a Sales Report, p. 112](#).

```
FORMDEF CORP ;
  OVERLAY SLSRPT ;
  OVERLAY HDR ;
  SUBGROUP OVERLAY SLSRPT HDR ;
PAGEDEF CORP
  WIDTH 6 IN
  HEIGHT 7 IN ;
  PRINTLINE POSITION 1.9 IN 2.5 IN ;           /*RECORD 1          */
  FIELD TEXT C 'SOUTHWEST REGION' ;           /*DEFAULT FIELD TEXT*/
                                           /*POSITION          */
  FIELD POSITION -.2 IN NEXT                     /*NOTE NEGATIVE VALUE*/
  TEXT 1 C 'JIM JONES - MANAGER' ;
```

```

FIELD START 1 LENGTH 23
  POSITION .1 IN .8 IN ;
PRINTLINE POSITION 2 IN 3.7 IN ;           /*RECORD 2           */
FIELD START 1 LENGTH 9 ;                   /*DEFAULT FIELD      */
                                           /*POSITION           */

FIELD START 10 LENGTH 5
  POSITION 2.5 IN * ;
PRINTLINE POSITION 1.5 IN 4 IN ;           /*RECORD 3           */
FIELD START 1 LENGTH 4 ;
SETUNITS LINESP 4 LPI ;

  POSITION .4 IN 4.7 IN ;
FIELD START 1 LENGTH 7 ;                   /*DEFAULT FIELD      */
                                           /*POSITION           */

FIELD START 10 LENGTH 3
  POSITION 1.6 IN * ;
FIELD START 16 LENGTH 3
  POSITION 2.9 IN * ;
FIELD START 21 LENGTH 3
  POSITION 4.3 IN * ;

```

In the previous command stream, the same basic commands from [Combining Field Processing and an Electronic Overlay, p. 111](#) are used, although the positions of fields have been changed to accommodate the new layout.

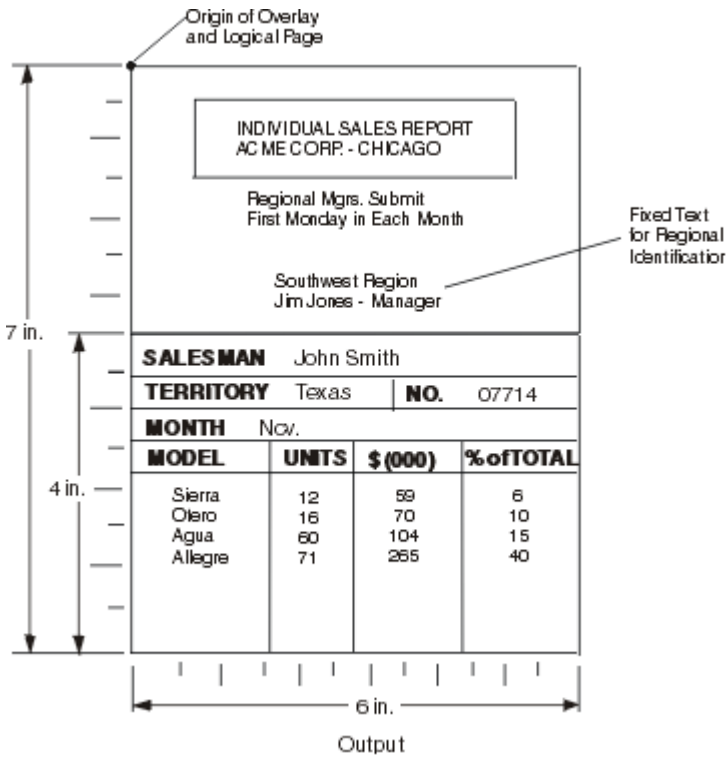

New **FIELD** commands with **TEXT** subcommands have been inserted in the first **PRINTLINE** command to produce the regional text, which is positioned at the bottom of the header form. The 1 is a duplication parameter indicating how many times the fixed text is to be repeated. The C can precede single-byte characters such as those used, for example, to write English or German. Both 1 and C are the default values for a **TEXT** subcommand. The text you want inserted appears between single quotation marks. Observe how the **POSITION** subcommands change to accommodate both fixed text and record-1 text.

↓ Note

Each **PRINTLINE** command in your PPFA command stream should have a corresponding record in the input data file. If you specify a fixed-text data field and an input data field under the same **PRINTLINE** command, they are both associated with the same input data file record. However, if all the **FIELD** commands under a **PRINTLINE** command specify fixed text, the corresponding input record is discarded. In that case, you should insert a blank record into the input data file to preserve the correct relationship between records and **PRINTLINE** commands.

Figure [The Corporate Version of the Sales Report with Fixed Text, p. 117](#) shows how the finished output looks.

The Corporate Version of the Sales Report with Fixed Text

Combining Two Reports into One Printout

This example combines two data files and two page layouts into one printout, also building on [Combining Field Processing and an Electronic Overlay, p. 111](#).

Figure [Input for a New Report Produced from the Combined Data Files, p. 118](#) shows the new data and a new overlay.

Input for a New Report Produced from the Combined Data Files

FIELD START 1 LENGTH 4 ; /*DEFAULT FIELD POSITION */
FIELD START 10 LENGTH 1
  POSITION 1.7 IN * ;
PRINTLINE POSITION 1.9 IN 2.6 IN ; /*RECORD 10 */
FIELD START 1 LENGTH 10 ;
PRINTLINE POSITION 4.2 IN 2.9 IN ; /*RECORD 11 */
FIELD START 1 LENGTH 1 ;
PRINTLINE POSITION 1 IN 3.7 IN ; /*RECORD 12 */
FIELD START 1 LENGTH 7 ;
PRINTLINE POSITION 1.7 IN 4.2 IN ; /*RECORD 13 */
FIELD START 1 LENGTH 15 ;
    
```

Although requiring a complex series of commands, the following commission report is handled much like any other field processing problem: the data must be carefully mapped into the overlay exactly where it is wanted. If, as in this example, you change copy groups and page formats, both the Invoke Medium Map structured field and the Invoke Data Map structured field must be inserted into the data file where the changes are desired. Here they occur together.

Figure [The Sales and the Commission Reports, p. 119](#) shows both the commission report and the sales report. With page printers and with careful data positioning, such reports look like they were individually prepared with no differences in the presentation of the fixed data.

The Sales and the Commission Reports

SALESMAN John Smith			
TERRITORY Texas		NO. 07714	
MONTH Nov.			
MODEL	UNITS	\$(000)	%ofTOTAL

Salesman's Commission Report
Acme Corp.

To: John Smith

As your sales for Nov. 1995 were \$498,000.00, and your commission rate is 2%, your monthly commission is \$9960.00. Should there be any question, please contact Al Jankowski in accounting.

Sincerely,
Acme Corp.

Conditional Processing

Conditional processing allows you to test fields within an input line data record (for example, a customer number). Based on the results of the test, you can specify the action to be taken such as to change copy groups or page formats. This section provides:

- An explanation of how conditional processing works
- A detailed list of rules, restrictions, and considerations
- Examples showing how conditional processing can be used to perform some commonly-requested functions

General Description

Conditional processing allows you to:

- Test the input data using the **CONDITION** command.
- Choose the copy group and page format to be used when printing the data.
- Change to a different copy group or page format after the data has been read. You can specify that the new copy group or page format is to be used:
 - Before printing the current subpage
 - Before printing the current line
 - After printing the current line
 - After printing the current subpage

Table [Conditional Processing Tasks, p. 120](#) shows the tasks you can perform with conditional processing.

Conditional Processing Tasks

Tasks	Location of Example
Stack offset from previous jobs	Jogging Output, p. 135
Use different print directions for front and back sides of a sheet	Duplex Output with Different Front and Back Print Directions, p. 135
Record reprocessing example	Record Reprocessing, p. 136
Select different paper sources	Selecting Paper from an Alternate Bin, p. 137
Multiple CONDITION commands	Multiple CONDITION Commands, p. 137
Repeat PRINTLINE commands	Field Processing When PRINTLINEs Are Repeated, p. 140

Using Conditional Processing versus Normal Line Data Processing

Normal line-data processing consists of:

- Setting up the physical page environment by defining a copy group
- Setting up the logical page environment by defining a page format

Input records correspond to **PRINTLINE** commands that determine such things as where the input records are to be printed, which font to use and what print direction to use. Only one copy group and page format can be used for processing each input record.

Conditional processing acts as a preprocessor by allowing you to test the input data before deciding which copy group and page format to use. Furthermore, you can change these specifications based on changes in the input data. Except for record reprocessing (explained in [Record Reprocessing Description and Processing, p. 125](#)), once the copy group and page-format specifications have been made, conditional processing operates the same as normal line-data processing.

 Note

The copy group and page format can also be changed by placing Advanced Function Presentation data stream (AFP data stream) Invoke Medium Map (IMM) and Invoke Data Map (IDM) structured fields in the input data. Use of these structured fields within the input print file causes results that differ from what is described in this section. Refer to *Mixed Object Document Content Architecture Reference* for information about these structured fields.

Using Conditional Processing to Set Up the Environment

2

Setting up the environment consists of selecting a copy group and a page format.

Selecting a Copy Group

Conditional processing can be used to *select* a copy group; it does not *process* the copy group.

As described in [Using Form Definition Commands, p. 25](#), a form definition contains the controls that govern the physical page on which the print file is to be printed. A form definition can contain one or more copy groups as shown in the following diagram.

PPFA Commands	Resulting Form Definition			
<pre> FORMDEF FDEFX . . COPYGROUP CGA . . OVERLAY ... SUBGROUP COPYGROUP CGB . . OVERLAY ... SUBGROUP ... COPYGROUP CGC . . OVERLAY ... SUBGROUP </pre>	<pre> F1FDEFX </pre> <table border="1" data-bbox="1023 1487 1219 1635"> <tr> <td>CGA</td> </tr> <tr> <td>CGB</td> </tr> <tr> <td>CGC</td> </tr> </table>	CGA	CGB	CGC
CGA				
CGB				
CGC				

The first copy group within a form definition is always active when processing of a print file begins. To select a different copy group, use the **CONDITION** command.

Note

By using the **BEFORE SUBPAGE** and **BEFORE LINE** parameters with conditional processing, you can change to a different active copy group before any lines have actually been formatted.

Using the previous diagram as a reference, assume copy group CGB is active. The copy-group selections that can be made from a **CONDITION** command are:

condname

which starts the named copy group

CURRENT

which *restarts* copy group CGB

=

which *restarts* copy group CGB (alternate for **CURRENT**)

NEXT

which starts copy group CGC

FIRST

which starts copy group CGA

NULL

which does *not* make any change to the current copy group processing

/

which does *not* make any change to the current copy group processing (alternate for **NULL**)

See [Using the CONDITION Command to Select a Copy Group and a Page Format](#), p. 133 for more information on each of these options.

Selecting a Page Format

Conditional processing can be used to *select* an active page format. Selecting the page format does not change the basic rules for processing a page format:

- **PRINTLINE** commands are processed sequentially unless skip-to-channel or spacing commands are used.
- When the end of the page format is reached, processing returns to the first **PRINTLINE** command in the same page format. Processing does *not* continue with the next page format (if any) in the page definition.

However, conditional processing does involve some additional considerations:

- Subpages
A page format consists of one or more subpages. A subpage is defined by a group of **PRINTLINE** commands followed by an **ENDSUBPAGE** command. If an **ENDSUBPAGE** command is not

defined, then the entire page format is one subpage. See [Subpage Description and Processing, p. 124](#) for more information.

- Record reprocessing
Record reprocessing is used when input records are processed according to one set of copy-group and page-format specifications, and then new specifications are invoked for the same input records. See [Record Reprocessing Description and Processing, p. 125](#) for more information.

As described in [Using Page Definition Commands for Traditional Line Data, p. 39](#), a page definition is a set of controls for formatting line-data for printing on a logical page. A page definition can contain one or more page formats as shown in the following diagram.

PPFA Commands	Resulting Page Definition
<pre> PAGEDEF PDEFX . . PAGEFORMAT PFMTA . . PRINTLINE ... PRINTLINE PAGEFORMAT PFMTB . . PRINTLINE ... PRINTLINE PAGEFORMAT PFMTC . . PRINTLINE ... PRINTLINE </pre>	<pre> P1PDEFX ┌───┬───┬───┐ │ PFMTA │ │ │ ├───┴───┴───┤ │ PFMTB │ │ │ ├───┴───┴───┤ │ PFMTC │ │ │ └───┴───┴───┘ </pre>

The first page format in the page definition is always active when processing of the print file begins. To invoke a new page format, use the **CONDITION** command.

Note

By using the **BEFORE SUBPAGE** and **BEFORE LINE** parameters, it is possible to change to a different active page format before any lines have actually been formatted.

Using the previous diagram as a reference, assume page format PFMTB is active. The page-format selections that can be made from a **CONDITION** command are:

condname

which starts the named page format

CURRENT

which *restarts* page format PFMTB

=

which *restarts* page format PFMTB (alternate for **CURRENT**)

NEXT

which starts page format PFMTB

FIRST

which starts page format PFMTA

NULL

which does *not* make any change to the current page format processing

/

which does *not* make any change to the current page format processing (alternate for **NULL**)

See [Using the CONDITION Command to Select a Copy Group and a Page Format, p. 133](#) for more information on each of these options.

Subpage Description and Processing

A page format consists of one or more subpages. A subpage is defined by a group of **PRINTLINE** commands followed by an **ENDSUBPAGE** command. If an **ENDSUBPAGE** command is not defined, then the entire page format is one subpage. The following considerations apply to subpages:

- Subpages are necessary only with conditional processing.
Multiple-up printing can be done with or without subpages being defined, but to change the page format or copy group at the level of one of the multiple-up pages, the multiple-up pages must be defined as subpages. In the following diagram, pages 1 through 4 can be defined as four separate subpages within one page format, or all defined within one subpage. However, in order to present the data on page 3 (for example) in a format different from that used for pages 1 and 2, the four pages must be defined as subpages.

- A subpage is processed sequentially starting from the beginning of the page format. Moving from one subpage to the next subpage is done by processing all the **PRINTLINE** commands for a given subpage, or by skipping (by means of the **CHANNEL** subcommand) or spacing to a **PRINTLINE** command in a different subpage.

↓ Note

Conditional processing cannot be used to select a subpage except by default. When a page format is started (or the *current* one is restarted), processing begins with the first **PRINTLINE** command of the page format. The effect is to select the first subpage in the page format.

Record Reprocessing Description and Processing

Record reprocessing is used when input records are processed according to one set of copy group and page format specifications, and then new specifications are invoked for the same input records. If the new specifications are to be applied using either the **BEFORE SUBPAGE** or the **BEFORE LINE** parameter, then the input records must be processed again using the new specifications instead of the original ones.

↓ Note

Input records are not printed twice; record reprocessing just changes the specifications used when formatting the records.

The process is shown in the following diagram.

PPFA Commands	Input Records																									
<pre> PAGEFORMAT PFMTA ; PRINTLINE POSITION 1 IN 1 IN DIRECTION ACROSS REPEAT 5 ; CONDITION cond1 START 2 LENGTH 1 WHEN EQ 'B' BEFORE SUBPAGE NULL PAGEFORMAT PFMTB ; PAGEFORMAT PFMTB ; PRINTLINE POSITION 7 IN 1 IN DIRECTION DOWN REPEAT 5 ; CONDITION cond2 START 4 LENGTH 1 WHEN EQ 'Y' BEFORE SUBPAGE NULL PAGEFORMAT PFMTA ; </pre>	<table border="1" data-bbox="1002 786 1241 1021"> <tr><td></td><td>A</td><td></td><td></td><td></td></tr> <tr><td></td><td>A</td><td></td><td></td><td></td></tr> <tr><td></td><td>B</td><td></td><td></td><td></td></tr> <tr><td></td><td>A</td><td></td><td></td><td></td></tr> <tr><td></td><td>A</td><td></td><td></td><td></td></tr> </table>		A					A					B					A					A			
	A																									
	A																									
	B																									
	A																									
	A																									

Assume page format PFMTA is active. Under normal processing the first input record would print in the **ACROSS** direction, starting at a horizontal offset of 1 inch and a vertical offset of 1 inch. However, the third record satisfies the **CONDITION** statement and causes a new page format (PFMTB) to be started. Since **CONDITION** *cond1* specifies **BEFORE SUBPAGE**, the first two records must be *reprocessed* using page format PFMTB. As a result, all of the records are printed in a **DOWN** direction, starting at a horizontal offset of 7 inches and a vertical offset of 1 inch.

If allowed to operate without restrictions, record reprocessing could force PSF into an infinite loop. For example:

PPFA Commands	Input Records																									
<pre> PAGEFORMAT PFMTA ; PRINTLINE POSITION 1 IN 1 IN DIRECTION ACROSS REPEAT 5 ; CONDITION cond1 START 2 LENGTH 1 WHEN EQ 'B' BEFORE SUBPAGE NULL PAGEFORMAT PFMTB ; PAGEFORMAT PFMTB ; PRINTLINE POSITION 7 IN 1 IN DIRECTION DOWN REPEAT 5 ; CONDITION cond2 START 4 LENGTH 1 WHEN EQ 'Y' BEFORE SUBPAGE NULL PAGEFORMAT PFMTA ; </pre>	<table border="1" data-bbox="1002 779 1241 1019"> <tr><td></td><td>A</td><td></td><td>X</td><td></td></tr> <tr><td></td><td>A</td><td></td><td>X</td><td></td></tr> <tr><td></td><td>B</td><td></td><td>X</td><td></td></tr> <tr><td></td><td>B</td><td></td><td>X</td><td></td></tr> <tr><td></td><td>B</td><td></td><td>Y</td><td></td></tr> </table>		A		X			A		X			B		X			B		X			B		Y	
	A		X																							
	A		X																							
	B		X																							
	B		X																							
	B		Y																							

As in the previous example, page format PFMTA is initially active, and input record 3 results in the selection of page format PFMTB. However, page format PFMTB has a condition that checks position four for the character 'Y', which is satisfied by input record 5. Therefore, if there were no restrictions, page format PFMTA would again be selected, the input data would be reprocessed (starting with input record 1), leading to an infinite loop.

To prevent this situation, after a **BEFORE** condition has been satisfied, all other **BEFORE** conditions are ignored until data has actually been formatted. See [Record Reprocessing, p. 128](#) for detailed information on this restriction.

Conditional Processing Rules, Restrictions, and Considerations

Multiple Conditions

Conditional processing supports:

- Multiple **PRINTLINE** commands in each subpage
- Multiple **CONDITION** commands on one **PRINTLINE** command
- Multiple **WHEN** statements on one **CONDITION** command

Rule

For *all these situations*, the rule is the same; the *first* true condition is the one processed, and any following true conditions are ignored.

Conditional Processing Considerations

Conditions are evaluated when they are encountered. For example, if a true condition has not been detected when an **OTHERWISE** statement is encountered, the **OTHERWISE** statement always results in a true condition. (An exception to this is explained in [Interaction Between the **CONDITION** Command and the **CHANNEL** Subcommand](#), p. 129.)

See [Multiple **CONDITION** Commands](#), p. 137 for an example of multiple **CONDITION** commands.

Record Reprocessing

Conditional Processing Restrictions

To prevent an infinite program loop, be aware that the following restrictions apply:

1. When the conditional action is to take place *before* the current subpage:
 - 1) Actions specified as taking place before the current subpage are shut off until the end of the current subpage.
 - 2) Actions specified as taking place before the current line are shut off for one line (the first line processed in the subpage).
2. When the conditional action is to take place before the current line, actions specified as taking place before the current subpage or before the current line are shut off for one line.

Considerations

- If a *before subpage* condition is true and causes a switch to a new page format, all *before subpage* conditions in the new page format are *ignored*.
- If a *before line* condition is true and causes a switch to a new page format, all *before subpage* and *before line* conditions in the new page format are ignored until one line has been processed.

The consequence of this is that, after a true condition, at least one line must be processed before the next *before* condition is considered. This can be confusing because a condition that would otherwise yield a true result can be ignored.

See [Record Reprocessing, p. 136](#) for an example of record reprocessing.

Interaction Between a **CONDITION** Command and a **REPEAT** Subcommand

See [Interaction Between the **CONDITION** Command and the **CHANNEL** Subcommand, p. 129](#) for what can appear to be an exception to the following rules.

Rule for a **CONDITION** Command and a **REPEAT** Subcommand

The **REPEAT** subcommand is used with the **PRINTLINE** command to specify the number of printlines (usually greater than one) that are to be constructed with the same specifications (font, direction, and so on). The **CONDITION** command is used to invoke conditional processing based on the data in a particular line. When the **REPEAT** and **CONDITION** commands are both specified for the same **PRINTLINE** command, *every line* described by the **PRINTLINE** command is checked for the given condition until either the condition is satisfied or there are no more lines described by the **PRINTLINE** command.

Note

This is different from the way in which the **CHANNEL** and **POSITION** subcommands interact with the **PRINTLINE** command. These two subcommands apply only to the *first line* described by the **PRINTLINE** command.

Rule for a **CONDITION** Command With an **OTHERWISE** Subcommand

The **REPEAT** subcommand is used with the **PRINTLINE** command to specify the number of printlines (usually greater than one) that are to be constructed with the same specifications (font, direction, and so on). The **CONDITION** command is used to invoke conditional processing based on the data in a particular line. The **CONDITION** command includes one or more **WHEN** subcommands and may include an **OTHERWISE** subcommand. If an **OTHERWISE** is coded, and none of the preceding **WHEN** conditions are true, the **OTHERWISE** condition *is always true*. If an **OTHERWISE** command is not coded, it is treated as a null.

Considerations

For the situation where **REPEAT** and **CONDITION** with **OTHERWISE** are coded for the same **PRINTLINE** command, the *first* input line determines the processing to be performed. This happens because either one of the **WHEN** conditions or the **OTHERWISE** condition is always true for the very first line.

Interaction Between the **CONDITION** Command and the **CHANNEL** Subcommand

Rule

A condition is checked if its associated **PRINTLINE** command is *actually processed*.

Note

ANSI carriage controls and machine (EBCDIC) carriage controls are processed differently. See the **SPACE_THEN_PRINT** subcommand in [Subcommands \(Long Form\)](#), p. 273 for more information.

ANSI

A skip or space occurs before printing the line.

Machine

The line is printed and then skipping or spacing is done.

For a **CONDITION** to be checked, it must be associated with the **PRINTLINE** command that is actually used for printing.

ANSI Skipping Consideration

The **PRINTLINE** command is not processed if a skip-to-channel-n character in the carriage control field causes the given **PRINTLINE** command not to be processed.

If a data record contains a character '1' (for example) in the carriage control field, and a **PRINTLINE** command has been specified with **CHANNEL 1** subcommand, the data record is processed under the "new" **PRINTLINE** command (the one that specified **CHANNEL 1**). Any **CONDITION** associated with the "old" **PRINTLINE** command is ignored (never even checked). See the following diagram for an example of this.

The character "1" in the carriage-control field of the fifth input record causes a page end before condition *cond1* is ever checked. Thus, the fifth input record is processed using the first **PRINTLINE** command of the current page format.

PPFA Commands	Input Records																																										
<pre> PAGEFORMAT PFMTA ; PRINTLINE CHANNEL 1 ; PRINTLINE ; PRINTLINE ; PRINTLINE ; PRINTLINE ; CONDITION cond1 START 6 LENGTH 1 WHEN EQ '5' AFTER SUBPAGE CURRENT NULL ; </pre>	<div style="text-align: center;"> <p>Carriage Control</p> <table border="1"> <tr> <td></td> <td>1</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> <td>6</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>1</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>2</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>3</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>4</td> </tr> <tr> <td>1</td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>5</td> </tr> </table> </div>		1	2	3	4	5	6		L	I	N	E		1		L	I	N	E		2		L	I	N	E		3		L	I	N	E		4	1	L	I	N	E		5
	1	2	3	4	5	6																																					
	L	I	N	E		1																																					
	L	I	N	E		2																																					
	L	I	N	E		3																																					
	L	I	N	E		4																																					
1	L	I	N	E		5																																					

Considerations

The **PRINTLINE** command is not processed if the **PRINTLINE** command is spaced over, for example, when multiple line spacing causes certain **PRINTLINE** commands to be bypassed.

If the input-record carriage-control field specifies a double space before print (for example), and a **CONDITION** command is specified for the spaced line, the **CONDITION** is ignored (never checked). Because the **OTHERWISE** subcommand is part of a **CONDITION** command, the **OTHERWISE** subcommand is also ignored.

This can be confusing. You might expect an **OTHERWISE** condition to be true if all other conditions have failed. In fact, the **OTHERWISE** condition can be true if it is associated with a **PRINTLINE** command that is actually processed. See the following diagram for an example of this. This assumes ANSI carriage controls have been specified for this print file. ANSI carriage control 'O' means space two lines before printing.

The fifth input record contains data (character "5" in the sixth position) that would normally satisfy the condition specified on the fifth **PRINTLINE** command. However, the character "O" in the carriage control field of input record 4 causes the fifth **PRINTLINE** command to be ignored. The fifth input record is processed by the sixth **PRINTLINE** command; therefore, the condition is not satisfied.

PPFA Commands	Input Records																																																	
<pre> PAGEFORMAT PFMTA ; PRINTLINE CHANNEL 1 ; PRINTLINE ; PRINTLINE ; PRINTLINE ; PRINTLINE ; CONDITION cond1 START 6 LENGTH 1 WHEN EQ '5' AFTER SUBPAGE CURRENT NULL ; PRINTLINE ; </pre>	<div style="text-align: center;"> <p>Carriage Control</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <tr> <td></td> <td>1</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> <td>6</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>1</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>2</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>3</td> </tr> <tr> <td>O</td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>4</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>5</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>6</td> </tr> </table> </div>		1	2	3	4	5	6		L	I	N	E		1		L	I	N	E		2		L	I	N	E		3	O	L	I	N	E		4		L	I	N	E		5		L	I	N	E		6
	1	2	3	4	5	6																																												
	L	I	N	E		1																																												
	L	I	N	E		2																																												
	L	I	N	E		3																																												
O	L	I	N	E		4																																												
	L	I	N	E		5																																												
	L	I	N	E		6																																												

WHEN CHANGE is Always False at Start of a Page Format

Rule

The **WHEN CHANGE** process compares the contents of a given field with the contents of the same field in the last record that was processed *with the current page format and current condition*. Whenever a page format is started (either by a condition that *changes* page formats or when processing of the *data file begins*), a **WHEN CHANGE** condition is always false because the previous record was not processed with the *current* page format.

Note

The following meanings apply to the previous statement:

changes

switching to a page format that has a different name

data file begins

if conditional processing invokes the **CURRENT** data map, **CHANGE** information is retained

Considerations

Ensure that the **WHEN CHANGE** statement is processed before the switch to a new page format has been performed. See [Rule, p. 131](#) for an example of how a combination of **WHEN CHANGE BEFORE SUBPAGE** and **WHEN CHANGE AFTER SUBPAGE** can lead to unexpected results.

Relationship of CC and TRC fields to the START Subcommand

Rule

The position specified by the **START** subcommand of the **CONDITION** command is in reference to the start of the *data record*. The first one or two bytes of an input record may contain either both a carriage-control character (CC) or a table-reference character (TRC). However, these characters are not considered part of the data record and are not to be counted when determining the **START** subcommand value. In the following example, the field being checked is actually the seventh character of the input record, but is the sixth character of the data record.

PPFA Commands	Input Records																																																	
<pre> PAGEFORMAT PFMTA ; PRINTLINE CHANNEL 1 ; PRINTLINE ; PRINTLINE ; PRINTLINE ; PRINTLINE ; CONDITION cond1 START 6 LENGTH 1 WHEN EQ '5' AFTER SUBPAGE CURRENT NULL; PRINTLINE ; </pre>	<p>Carriage Control</p> <table border="1"> <tr> <td></td> <td>1</td> <td>2</td> <td>3</td> <td>4</td> <td>5</td> <td>6</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>1</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>2</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>3</td> </tr> <tr> <td>O</td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>4</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>5</td> </tr> <tr> <td></td> <td>L</td> <td>I</td> <td>N</td> <td>E</td> <td></td> <td>6</td> </tr> </table>		1	2	3	4	5	6		L	I	N	E		1		L	I	N	E		2		L	I	N	E		3	O	L	I	N	E		4		L	I	N	E		5		L	I	N	E		6

	L	I	N	E		1																																												
	L	I	N	E		2																																												
	L	I	N	E		3																																												
O	L	I	N	E		4																																												
	L	I	N	E		5																																												
	L	I	N	E		6																																												

Using the **CONDITION** Command to Select a Copy Group and a Page Format

Rules

1. Within the **CONDITION** command, a copy group and a page format can be specified by using either a specific name or a parameter (**CURRENT** or **=**, **FIRST**, **NEXT**) or **NULL** or **/** can be specified. The use of the **NULL** or **/** parameters differs from the use of the others:

Others

When any parameter other than **NULL** or **/** is specified, the specifications for the copy group or page format selected replace the current specifications. When the current specifications are replaced, the action is referred to as starting or restarting the copy group or page format. In AFP terminology, an Invoke Medium Map (IMM) command is generated for a copy group and an Invoke Data Map (IDM) command is generated for a page format.

NULL or **/**

When **NULL** or **/** is specified, no IMM or IDM is generated and processing continues as if no condition check was present.

2. The **COPYGROUP** and the **PAGEFORMAT** parameters are positional. If both parameters are specified, the **COPYGROUP** parameter must be first. If you want only to specify the copy group, the **PAGEFORMAT** parameter can be omitted, or specified as **NULL** or **/**. However, if you want only to specify the page format, the **COPYGROUP** parameter must be specified as **NULL** or **/**.

Considerations

Starting or Restarting a Copy Group

When a copy group is started (or restarted), the remaining input data is forced to the start on the next *sheet*. Therefore, if duplex output was expected, but the copy group is restarted while processing the front side of a sheet, the remaining data starts on the front side of the *next* sheet rather than on the back side of the current sheet.

See [Duplex Output with Different Front and Back Print Directions, p. 135](#) for an example.

Furthermore, observe that any copy group action except **NULL** restarts the page format (see the following item).

Starting or Restarting a Page Format

When a page format is started (or restarted), the remaining input data is forced to the start on the next side. Furthermore, that data is processed starting with the first **PRINTLINE** command in the specified page format. This is true even if **CURRENT** is specified as the page format parameter.

Not Restarting a Copy Group

If the copy group is not to be restarted, specify **NULL** or **/**. Do *not* specify **COPYGROUP NULL** or **COPYGROUP /**.

The following example illustrates this point. The command sequence on the left invokes a copy group named **NULL**. The command sequence on the right leaves the current copy group active.

Incorrect Format	Correct Format
<pre>CONDITION condname START... : WHEN... COPYGROUP NULL :</pre>	<pre>CONDITION condname START... : WHEN... NULL :</pre>

Not Restarting a Page Format

If the page format is not to be restarted, specify **NULL** or **/** (or omit the specification). Do *not* specify **PAGEFORMAT NULL** or **PAGEFORMAT /**.

The following example illustrates this point. The command sequence on the left invokes a page format named **NULL**. The command sequence on the right leaves the current page format active.

Incorrect Format	Correct Format
<pre>CONDITION condname START... : WHEN... COPYGROUP CGA PAGEFORMAT NULL :</pre>	<pre>CONDITION condname START... : WHEN... COPYGROUP CGA NULL :</pre>

Variable Length Records and the CONDITION Command

Considerations

The **CONDITION** command inspects a field that starts at a particular position and extends for a certain length. If the *entire* field is not available within the input record, the condition is always false. If the input file contains variable-length records, the record may not extend the full length specified by the **START** and **LENGTH** subcommands. In this way, a condition which seems as if it should be satisfied can actually fail.

Truncation of Blanks and the CONDITION Command

Considerations

Truncation occurs when blank characters are removed from the end of records on the spool. If blank truncation is in effect, the result can be the same as if the input file contained variable-length records.

Blank truncation is a consideration at the time the input records are passed to the print server. In the JES2 environment, blank truncation occurs unless the **BLNKTRNC=NO** parameter is specified. In the JES3 environment, blank truncation occurs unless the **TRUNC=NO** parameter is specified as part of either the **BUFFER** or **SYSOUT** initialization statements. Blank truncation can affect conditional processing since a field could "disappear" by being truncated causing no **WHEN/OTHERWISE** clause to be executed.

Conditional Processing Examples

This section provides conditional processing examples. The examples are grouped into functionally similar applications and are increasingly complex. The examples provided are:

- Jogging output based on a change in the input data
- Duplex output with different front and back print directions
- Record reprocessing
- Selecting paper from an alternate bin
- Multiple **CONDITION** commands

Jogging Output

This example shows how to jog the printed output, based on a change in the input data.

Copy group CGJOG specifies *JOG YES*. Page format PFJOG contains a **CONDITION** command that checks for any change in positions 8 through 10. If a change is detected, copy group CGJOG is restarted. Observe that the only result is to start printing on a new sheet and to jog that sheet.

Example of Jogging Output

```
FORMDEF TJOG;
  COPYGROUP CGJOG JOG YES;

PAGEDEF TJOG;
  PAGEFORMAT PFJOG WIDTH 11 IN HEIGHT 8.5;
  PRINTLINE REPEAT 50
    CHANNEL 1;
  CONDITION NUPAGE START 8 LENGTH 3
    WHEN CHANGE BEFORE SUBPAGE
  COPYGROUP CGJOG;
```

Duplex Output with Different Front and Back Print Directions

This example shows how to establish one print direction on the front side and a different print direction on the back side of a duplex sheet.

The page definition in this example contains two page formats, each of which has a **CONDITION** statement that always returns a true value. The value is true because the character in position 1 always has a value greater than or equal to hexadecimal zero. Therefore, every time a page change occurs (front to back, or back to next front) a different page format is started. The different **DIRECTION** statements in the two page formats change the layout of the text on the page.

Observe that the **COPYGROUP** parameter is specified as **NULL**. If a parameter other than **NULL** or / is specified for **COPYGROUP**, the copy group restarts every time a page change occurs. Because restarting a copy group forces data to a new sheet, duplex printing *does not occur*.

Example of Duplex Output

```
FORMDEF XMPDUP
  DUPLEX NORMAL;

CONDITION GOTOFRNT START 1 LENGTH 1
  WHEN GE X'00' AFTER SUBPAGE NULL PAGEFORMAT P2FRONT;
PRINTLINE REPEAT 59;

```

Record Reprocessing

This example uses the **BEFORE SUBPAGE** function with record reprocessing because the copy group and page format cannot be determined until input record 3 for each subpage has been read.

Note

1. This example includes two subpages.
2. The **CONDITION** command specifies that the action to be performed is **NEWFORM**. Therefore, if the condition is satisfied, the data in the current subpage is forced to start on the next form. If the data is already at the start of a new form, no action is performed. In other words, a blank page is not generated.

Example of Record Reprocessing

```

/* Page definition for 2-up printing */
/* Test field in line 3 of each subpage */
/* Eject to new sheet if the field changes. */

PAGEDEF REPROC
  WIDTH 10.6 HEIGHT 8.3 DIRECTION DOWN;

PAGEFORMAT PFREPROC;

/* Definition of first subpage */
PRINTLINE CHANNEL 1
  REPEAT 2
  POSITION MARGIN TOP;

PRINTLINE REPEAT 1
  POSITION MARGIN NEXT;
CONDITION EJECT
  START 5 LENGTH 5
  WHEN CHANGE BEFORE SUBPAGE
  NEWFORM;

PRINTLINE REPEAT 40
  POSITION MARGIN NEXT;
ENDSUBPAGE;

/* Definition of second subpage */
PRINTLINE CHANNEL 1
  REPEAT 2
  POSITION 5.3 TOP;

```

```

PRINTLINE REPEAT 1
          POSITION 5.3 NEXT;
          CONDITION EJECT;

PRINTLINE REPEAT 40
          POSITION 5.3 NEXT;
ENDSUBPAGE;

```

Selecting Paper from an Alternate Bin

This example selects the first sheet from the alternate bin and all other pages from the primary bin. This function is useful when special paper (such as one having the company logo) is to be used for the first page of a document.

Note

Bin selection is overridden by the printer should the form defined to each bin be the same form number. Only the primary bin is selected.

Example of Selecting Paper from an Alternate Bin

```

/* The form definition contains two copy groups -- */
/*  ALTBIN - for the first page                    */
/*  PRIBIN - for all other pages                   */

FORMDEF BINEX
  DUPLEX NO;
  COPYGROUP ALTBIN BIN 2;
  COPYGROUP PRIBIN BIN 1;

PAGEDEF BINEX
  WIDTH 8.3  HEIGHT 10.6;

/* Pageformat for first page - bin 2              */

PAGEFORMAT FIRST;
  PRINTLINE CHANNEL 1
            POSITION MARGIN TOP;
  CONDITION GOTOPRIM  START 1 LENGTH 1
  WHEN GE X'00'  AFTER SUBPAGE
  COPYGROUP PRIBIN PAGEFORMAT REST;
  PRINTLINE REPEAT 59;

/* Pageformat for all other pages - bin 1         */

PAGEFORMAT REST;
  PRINTLINE CHANNEL 1
            POSITION MARGIN TOP
            REPEAT 60;

```

Multiple CONDITION Commands

Two examples are shown here. The first example shows how two **CONDITION** commands can interact to give unintended results. The second example shows how to use the two **CONDITION** commands to achieve the correct results.

Multiple **CONDITION** Command: Incorrect Solution

The example in Figure [Example of INCORRECT Solution, p. 138](#) demonstrates how two **CONDITION** commands can interact to give unintended results. Specifically, one **CONDITION** command causes a change of page format and then a second **CONDITION** command inspects a field with a **WHEN CHANGE** subcommand.

The purpose of condition:

NEWREP

Starts a new report on a new sheet of paper whenever the specified field changes and jogs the output so the report can be easily located.

SHIFTB and SHIFTF

Handle the situation where all four subpages of the front (or back) contain data.

In this situation, the objective is to change the print direction of the text on the page.

In the situation where both conditions *seem* to be true at the same time, the results may be unexpected.

↓ Note

Condition **SHIFTB** (or **SHIFTF**) takes effect *after* the current subpage and therefore precedes the *before subpage* processing defined by condition **NEWREP**. Because condition **SHIFTB** results in starting a new page format, condition **NEWREP** returns a false value, and the expected new report processing is not performed.

Example of **INCORRECT** Solution

```
FORMDEF XMPICO OFFSET 0 0 DUPLEX RTUMBLE JOG YES REPLACE YES;
COPYGROUP CG1;
  OVERLAY OVLY1;
  OVERLAY OVLY2;
  SUBGROUP      OVERLAY OVLY1 FRONT;
  SUBGROUP      OVERLAY OVLY2 BACK ;

PAGEDEF XMPICO REPLACE YES;
  FONT GT24;
  FONT GT12;

  /* Definition of pageformat for front side */
  PAGEFORMAT PFFRONT WIDTH 11 IN HEIGHT 8.5 IN DIRECTION UP;
SETUNITS 1 PELS 1 PELS LINESP 16 LPI;
  PRINTLINE REPEAT 1 CHANNEL 1 FONT GT24 POSITION 75 188;
  CONDITION NEWREP START 8 LENGTH 3
    WHEN CHANGE BEFORE SUBPAGE COPYGROUP CG1 PAGEFORMAT PFFRONT;
  PRINTLINE REPEAT 40 FONT GT24 POSITION 75 NEXT;
  ENDSUBPAGE;

  PRINTLINE REPEAT 1 CHANNEL 1 FONT GT24 POSITION 1377 188;
  CONDITION NEWREP START 8;
  PRINTLINE REPEAT 40 FONT GT24 POSITION 1377 NEXT;
  ENDSUBPAGE;

  PRINTLINE REPEAT 1 CHANNEL 1 FONT GT24 POSITION 75 1102;
  CONDITION NEWREP START 8;

ENDSUBPAGE;

PRINTLINE REPEAT 1 CHANNEL 1 FONT GT12 POSITION 75 1335;
CONDITION NEWREP START 8;
CONDITION SHIFTF START 1 LENGTH 1
    WHEN GE X'00' AFTER SUBPAGE NULL PAGEFORMAT PFFRONT;
PRINTLINE REPEAT 40 FONT GT12 POSITION 75 NEXT;
ENDSUBPAGE;

```

Multiple CONDITION Command: Correct Solution

The example in Figure [Example of CORRECT Solution, p. 139](#) differs from the example in Figure [Example of INCORRECT Solution, p. 138](#) in two significant ways:

- Because the page format for the back side is the first one defined in the page definition, it is the one that is initially active
- Both **CONDITION** commands (**NEWREP** and **SHIFTF**) specify that the action should happen before the current subpage has been processed

When processing begins, condition **NEWREP** fails because this is a **WHEN CHANGE** condition and the page format has just been started. However, condition **SHIFTF** returns a true result, and the **NEXT** page format (PFFRONT) is started. No lines have been formatted, so condition **SHIFTF** has the effect of moving to the page format for the front side.

Example of CORRECT Solution

```

FORMDEF XMPCOR OFFSET 0 0 DUPLEX RTUMBLE JOG YES REPLACE YES;

```

Field Processing When PRINTLINES Are Repeated

The following examples show the effect of the **[LINE | FIELD]** parameter on **REPEAT** *n*.

The first **PRINTLINE** example uses **FIELD** type repetition. The second **PRINTLINE** example shows **LINE** type repetition.

Note

When **LINE** type repetition is used, **SETUNITS LINESP** may need to be set to a higher value to avoid over printing.

REPEAT n type FIELD Example

```

PAGEDEF rept01 WIDTH      8.0 IN
              HEIGHT     10.5 IN
              LINEONE     0.2 IN 0.2 IN
              DIRECTION   ACROSS
              REPLACE     YES;

```

N_UP Printing

With **N_UP** printing, which is defined in the form definition, you can print up to four pages on a sheet of paper in simplex mode and up to eight pages in duplex mode. Each of these pages are independent, allowing use of different page formats and copy groups for each page. This provides significantly more flexibility and function than the traditional multiple-up capability which is defined in the page definition. Refer to [N_UP Compared to Multiple-Up, p. 163](#) for more differences between **N_UP** printing and multiple-up printing.

There are two levels of **N_UP**:

- Basic **N_UP**, supported by older AFP printers: 3825, 3827, 3828, 3829, 3835, and 3900-001.
- Enhanced **N_UP**, supported by printers with the Advanced Function Common Control Unit (AFCCU).

↓ Note

You must have the correct level of PPFA to generate basic or enhanced **N_UP** commands and the correct level of PSF for your operating system to drive the printer in the basic or enhanced **N_UP** mode.

N_UP Partitions and Partition Arrangement

2

A key concept in **N_UP** printing is the *partition*. In both basic and enhanced **N_UP**, each sheet of paper is divided into equal-size areas called partitions. Pages are placed in these partitions in sequential order in basic **N_UP**. Pages are placed in relation to one or more of these partitions in enhanced **N_UP**. Knowing the partition arrangement is critical to designing applications using **N_UP**.

↓ Note

If you are using basic **N_UP** printing with PSF set to **DATAACK=BLOCK**, data must fall within the boundary of the partition. Any data placed outside the edge of the partition boundary is not printed, and no error message is generated. However, enhanced **N_UP** printing allows pages to overlap partitions. The only limits are that the pages must not extend beyond the boundaries of the physical sheet, and the pages must not exceed the total number of **N_UP** partitions specified for the sheet.

The number, size, and position of partitions are determined by three things:

- The **N_UP** value (1, 2, 3, or 4)
- The size and shape of the sheet of paper
- The form definition presentation options, **PRESENT** and **DIRECTION**

When printing in duplex mode, the same number of partitions is also defined for the back of the sheet. For normal duplex, back partitions are placed as if the sheet were flipped around its right side or *y-axis*. For tumble duplex, they are placed as if the sheet were flipped around its top edge, or *x-axis*. See Figure [N_UP 2 Partition Numbering, Front Sheet-Side, p. 145](#) and Figure [N_UP 3 Partition Numbering, Front Sheet-Side, p. 146](#) for illustrations of duplex partitions.

The figures on the following pages show the partition arrangement that results from every combination of **N_UP** value, paper size, and presentation option. The hex values (X 00, X 01, X 04, X 05, X 02, X 03) indicate how the Medium Orientation Triplet (X'68') specifies the position and orientation of the medium presentation space on the physical medium.

Use these figures to determine how your **N_UP** application is formatted by the printer. In the figures, each equal-sized partition has a number indicating its default presentation sequence. The origin for each partition is in the same relative position as the origin point shown for the medium. This point serves as the top left corner for a page printed in the **ACROSS** (or 0°) printing direction.

N_UP 3 Partition Numbering, Back Sheet-Side, Tumble Duplex

N_UP 4 Partition Numbering, Back Sheet-Side, Tumble Duplex

Basic N_UP Printing

You can specify the **N_UP** subcommand on either the **FORMDEF** or **COPYGROUP** commands in the form definition. Figure [Subcommands for Basic N_UP Printing, p. 151](#) shows the subcommands and parameters enabled with basic N_UP printing.

Subcommands for Basic N_UP Printing

FORMDEF Subcommand

```
[N_UP {1 | 2 | 3 | 4}[OVERLAY Subcommand...]]
[INVOKE {SHEET | NEXT | FRONT | BACK}];
```

OVERLAY Subcommand

```
OVERLAY name [x-pos y-pos] [PARTITION]
[OVROTATE {0 | 90 | 180 | 270}] [PF0]
```

COPYGROUP Subcommand

```
[N_UP {1 | 2 | 3 | 4}[OVERLAY Subcommand...]]
[INVOKE {SHEET | NEXT | FRONT | BACK}];
```

OVERLAY Subcommand

```
OVERLAY name [x-pos y-pos] [PARTITION]
[OVROTATE {0 | 90 | 180 | 270}] [PF0]
```

The **N_UP** subcommand divides the medium into one, two, three, or four partitions, as described in [N_UP Partitions and Partition Arrangement, p. 144](#). The **OVERLAY** subcommand prints a page overlay in each partition at a specified offset from the page origin or the partition origin. For more information about page overlays, see [Medium Overlays and Page Overlays, p. 162](#).

The **INVOKE** subcommand controls the action that occurs if you invoke a new copy group. You can invoke copy groups using conditional processing in the page definition or by including an Invoke Medium Map (IMM) structured field in the print data. The default action is to eject to a new sheet. By specifying an **INVOKE** subcommand on a **COPYGROUP** command, you can instead eject to a new **N_UP** partition, which may be on the same sheet. If printing in duplex mode, you can specify whether to eject to a partition on the front or back side of the sheet.

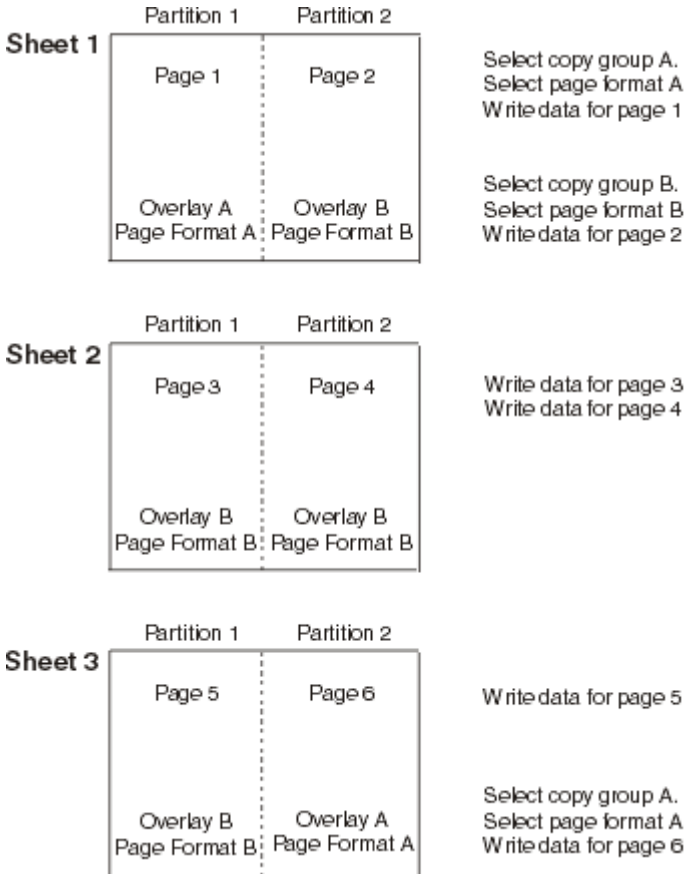

You must use page overlays instead of medium overlays if you want to change overlays while ejecting to a new partition. PSF honors the **NEXT**, **FRONT**, and **BACK** values of the **INVOKE** subcommand only if the new copy group has the same medium modifications as the previous copy group. Medium modifications include duplexing, bin, page offset, **N_UP** values, presentation, direction, and medium overlays. If any of these modifications differ, PSF ejects to a new sheet when the copy group is invoked.

By combining **INVOKE** with the **N_UP OVERLAY** subcommand, you can place different page overlays in different partitions when you change copy groups. This is illustrated in [Basic N_UP Example 1: Using INVOKE and OVERLAY, p. 152](#).

The following examples show the use of basic **N_UP**. Because each example builds on the previous one, read them in sequential order to better understand basic **N_UP**. All the pages used in the examples are formatted in the **ACROSS** printing direction. Their orientation on the media is the result of using the available **PRESENT** and **DIRECTION** combinations in the **FORMDEF** command.

Basic N_UP Example 1: Using INVOKE and OVERLAY

Basic N_UP Example 1: Using INVOKE and OVERLAY

Form Definition for Basic N_UP Example 1

```
FORMDEF TWOUPS ;
COPYGROUP A
  N_UP 2
  OVERLAY A
  INVOKE NEXT ;
COPYGROUP B
  N_UP 2
  OVERLAY B
  INVOKE NEXT ;
```

Figure [Basic N_UP Example 1: Using INVOKE and OVERLAY](#), p. 152 shows the **INVOKE** and **OVERLAY** functions of basic **N_UP** printing. Specifying **INVOKE NEXT** on the **COPYGROUP** command ensures that when the copy group is invoked by an Invoke Medium Map (IMM) structured field with conditional processing, the next page is placed in the next partition of the **N_UP** form.

The **OVERLAY** subcommand specifies a *page overlay*, which can be positioned relative to the page origin or relative to the partition origin. In basic **N_UP**, the **OVERLAY** subcommand prints the overlay with the page data in every partition on the sheet. However, as shown in this example, using **INVOKE NEXT** allows the application to use different overlays in different partitions.

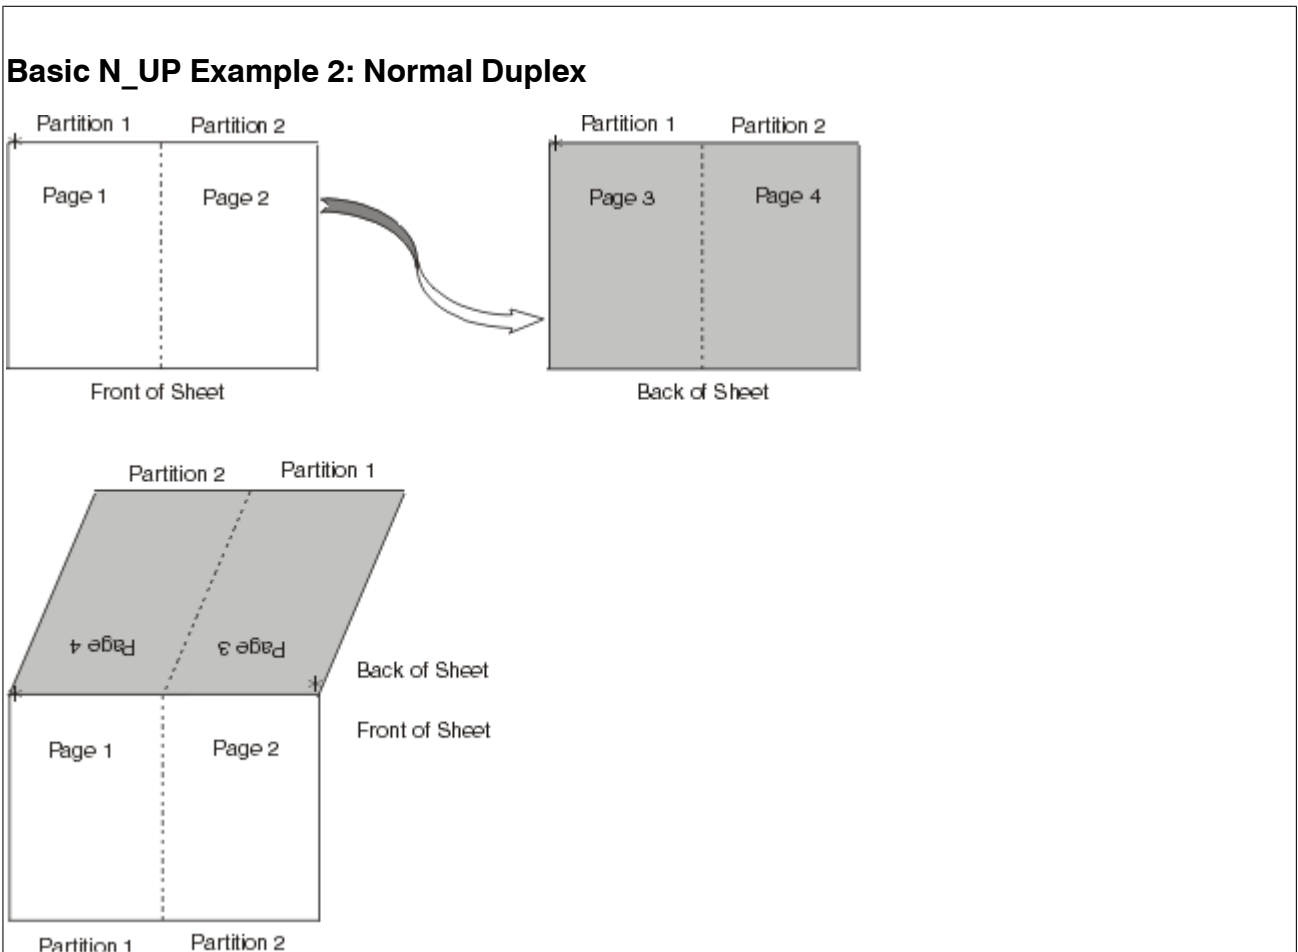

Example 1 has been defined as **N_UP 2** simplex with the default **PORTRAIT ACROSS** presentation, which results in the partitions illustrated in Figure [Basic N_UP Example 1: Using INVOKE and OVERLAY, p. 152](#). The application uses different page formats on different application pages. With **N_UP**, changing page formats ejects to the next partition, just as it ejects to a new page in applications without **N_UP**.

The application also needs different overlays on different pages. Because the overlays are specified on **N_UP** in the **COPYGROUP** subcommand, the application accomplishes this by changing copy groups. Without the **INVOKE** subcommand, changing the copy group forces an eject to a new physical sheet. However, because **INVOKE NEXT** is specified, the eject is to the next partition. Changing to copy group B after page 1 is written places page 2 in partition 2 of the same physical sheet. If the change is made after a page is placed in partition 2, the eject to the next partition is to partition 1 of the next sheet. The page is printed with the overlay specified in the new copy group.

Note

1. The pages in this example are line-format print data, formatted using a page definition. The example would be the same for MO:DCA data, except that page formats would not be used.
2. You can select the copy groups and page formats by including IMM and IDM structured fields in the print data or by using conditional processing in the page formats.
3. Overlays can be defined as *page overlays* in the page definition or in the form definition **N_UP** or **PLACE** subcommands. Overlays can also be defined as *medium overlays* in the form definition **SUBGROUP** command. If you want to change overlays when ejecting to a new partition, use *page overlays* instead of medium overlays. See [Medium Overlays and Page Overlays, p. 162](#) for information about page and medium overlays.

Basic N_UP Example 2: Normal Duplex

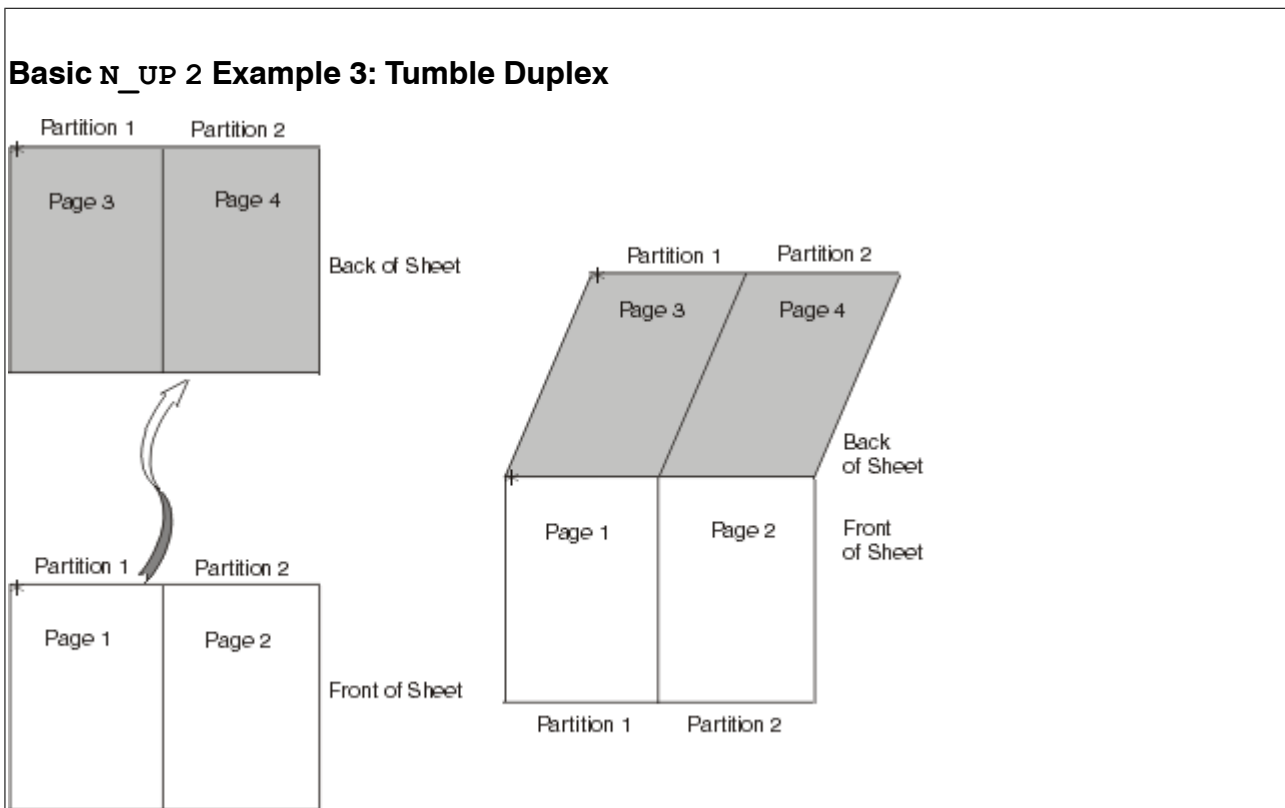

Form Definition for Basic N_UP Example 2: Normal Duplex

```
FORMDEF NUFDUP
N_UP 2
PRESENT PORTRAIT
DIRECTION ACROSS
DUPLEX NORMAL ;
```

The previous figure shows the partition order for duplexed pages. This figure also shows the partitions into which the sheet is divided for **N_UP 2** with **PORTRAIT** presentation and **ACROSS** direction. With normal duplex, the sheet is rotated around its *y-axis*, which is the right edge of the sheet. The result is that partition 2 for the back side of the sheet is on the back of partition 1 for the front side, and page 4 is on the back of page 1. The tops of pages 3 and 4 are aligned with the tops of pages 1 and 2.

Basic N_UP 2 Example 3: Tumble Duplex

Form Definition for Basic N_UP 2 Example 3: Tumble Duplex

```
FORMDEF NUPTUM
N_UP 2
PRESENT PORTRAIT
DIRECTION ACROSS
DUPLEX TUMBLE ;
```

The previous figure shows the partition order for tumble duplex pages. This figure also shows the partitions into which the sheet is divided for **N_UP 2** with **PORTRAIT** presentation and **ACROSS** direction. With tumble duplex, the sheet is rotated around its *x-axis*, which is the top of the sheet. The result is that partition 1 of the back of the sheet falls on the back of partition 1 for the front, and page 3 falls on the back of page 1. The tops of pages 3 and 4 are aligned with the bottoms of pages 1 and 2. For more information about normal and tumble duplex printing, refer to [Normal Duplex and Tumble Duplex, p. 23](#).

Enhanced N_UP Printing

Enhanced **N_UP** is supported on AFP continuous forms printers. In addition to all the function of basic **N_UP**, enhanced **N_UP** includes the powerful **PLACE** subcommand.

Using the **PLACE** subcommand, you can place pages in the partitions in any sequence, specify unique overlays for each page, and rotate both the page and the overlays in the partitions. You can place multiple pages in the same partition and no pages in other partitions, and you can extend pages across partition boundaries. In short, you can place pages of any size at any location on the front or back of

the sheet, in any orientation. The only limits are that the pages must not extend outside the boundaries of the physical sheet, and the pages must not exceed the total number of **N_UP** partitions specified for the sheet.

You use a single **PLACE** command to place each page of data on the sheet. You must specify the same number of **PLACE** commands as the number of **N_UP** partitions for the sheet. This is required for error recovery and restart integrity. If you do not want to place as many pages as partitions, you can specify **CONSTANT** on a **PLACE** command to indicate that no data is to be placed in the partition. You can specify the **OVERLAY** subcommand with the **CONSTANT** subcommand to place overlays without user's data. The syntax diagrams in Figure [Subcommands for Enhanced N_UP Printing, p. 156](#) show the subcommands and parameters enabled with enhanced **N_UP** printing.

For most applications, place constant overlays **before** placing data on the sheet. This is because the overlay is not actually placed until the next page of data is placed. If your application changes copy groups or runs out of pages on the sheet before reaching the constant overlay **PLACE** subcommand, the constant overlay is not printed. However, if you do not want the overlays to print in these cases, place the constant overlay after placing the page data.

Subcommands for Enhanced N_UP Printing

FORMDEF Subcommand

```
[N_UP {1 | 2 | 3 | 4} [OVERLAY Subcommand... | PLACE Subcommand...]]
[INVOKE {SHEET | NEXT | FRONT | BACK}]
```

COPYGROUP Subcommand

```
[N_UP {1 | 2 | 3 | 4} [OVERLAY Subcommand... | PLACE Subcommand...]]
[INVOKE {SHEET | NEXT | FRONT | BACK}]
```

OVERLAY Subcommand

```
OVERLAY name [x-pos - y-pos] [PARTITION]
[OVROTATE {0 | 90 | 180 | 270}] [PF0]
```

PLACE Subcommand

```
PLACE n [FRONT | BACK] [CONSTANT] [OFFSET x-pos y-pos]
[OVERLAY Subcommand] [ROTATION {0 | 90 | 180 | 270}] [VIEW {YES | NO}]
```

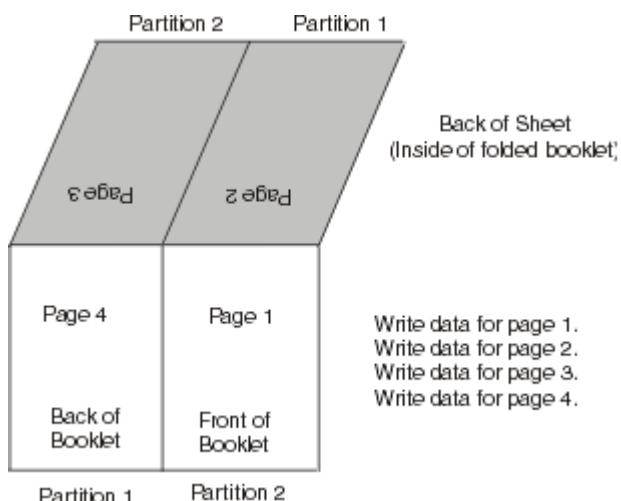

Note

The use of the **PLACE** subcommand indicates enhanced **N_UP** printing.

The following examples show enhanced **N_UP** printing. Read these examples in sequence to better understand enhanced **N_UP** printing.

Enhanced N_UP Example 1: Using PLACE

Enhanced N_UP Example 1: Using PLACE

Form Definition for Enhanced N_UP Example 1

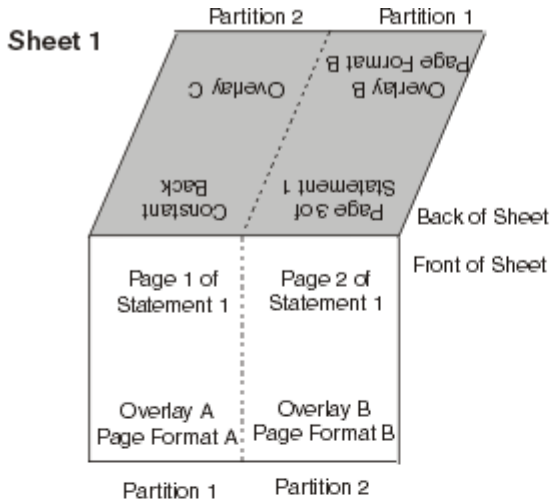

```
FORMDEF BOOKLT DUPLEX NORMAL
      N_UP 2
/* Page 1 */   PLACE 2 FRONT
/* page 2 */   PLACE 1 BACK
/* Page 3 */   PLACE 2 BACK
/* Page 4 */   PLACE 1 FRONT ;
```

The previous figure shows the function of the **PLACE** subcommand in specifying the sequence of partitions into which pages are placed. This example is **N_UP 2** duplex. The default partition sequence is from left to right. Notice that when printing in normal duplex, partition 1 on the back of the sheet aligns with partition 2 on the front of the sheet. See Figure [Basic N_UP Example 2: Normal Duplex, p. 154](#) and Figure [Basic N_UP 2 Example 3: Tumble Duplex, p. 155](#) for information on **N_UP** duplex partitions.

For this booklet, you do not want to print pages in the default order: partitions 1 and 2 on the front, followed by partitions 1 and 2 on the back. Instead, print the pages so that when the sheet is folded, you have a booklet, with page 1 on the front outside of the booklet, pages 2 and 3 inside the folded booklet, and page 4 on the back outside of the booklet. The form definition shown in the figure on the previous page uses the **PLACE** subcommand of enhanced **N_UP** to place pages in the partitions in the order needed to accomplish this. The application writes the pages in order, page 1 through page 4, and the **N_UP** form definition provides the correct sequencing in the partitions.

Form Definition for Enhanced N_UP Example 2

```
FORMDEF STATMT DUPLEX NORMAL ;

COPYGROUP PAGE1
  INVOKE BACK
  N_UP 2
  PLACE 2 BACK      CONSTANT OVERLAY C
  PLACE 1 FRONT    OVERLAY A
  PLACE 1 BACK      CONSTANT OVERLAY C
  PLACE 2 FRONT    OVERLAY A ;

COPYGROUP PAGON
  INVOKE NEXT
  N_UP 2
  PLACE 1 FRONT    OVERLAY B
  PLACE 2 BACK     OVERLAY B
  PLACE 2 FRONT    OVERLAY B
  PLACE 1 BACK     OVERLAY B ;
```

The previous figure introduces the **CONSTANT** subcommand of enhanced **N_UP** and shows the functions of the **PLACE** subcommand, which was described in [Enhanced N_UP Example 1: Using PLACE, p. 157](#) and the **INVOKE** subcommand, which was described in [Basic N_UP Example 1: Using INVOKE and OVERLAY, p. 152](#). This figure represents a user application that is printing customer statements using the values **N_UP 2** duplex. The **PLACE** subcommand places the pages in the correct order for post-processing equipment to cut the sheets into individual pages and interleave them to produce sequential pages. The **INVOKE** subcommand guarantees that one customer's statement is never printed on the back side of another customer's statement. The **N_UP 2** subcommand, combined with the default **PORTRAIT ACROSS** presentation, divides the sheet into the two partitions illustrated in [Enhanced N_UP Example 2: Using CONSTANT and OVERLAY, p. 158](#).

In the previous figure, page 1 of each customer's statement is printed with overlay A. The back side of page 1 is a constant overlay, with no user's data. The remaining pages of each customer's statement are printed with overlay B.

The copy groups place the required overlays on both the right and left halves of the sheet, so that a new customer statement can begin on either half of the sheet. **COPYGROUP PAGON** assigns overlay B to all partitions on the sheet. **COPYGROUP PAGE1** assigns overlay A to all front partitions and overlay C to all back partitions. The **CONSTANT** parameter used with **OVERLAY C** means that no user's data is printed in the partition with the overlay. To guarantee that the constant overlay prints whenever page 1 is printed, the **PLACE** subcommand for the constant overlay is specified before the **PLACE** subcommand for page 1 print data. The **INVOKE** subcommand specifies **BACK** to ensure that the overlay is printed on the back of the partition.

In the application shown in Figure [Enhanced N_UP Example 2: Using CONSTANT and OVERLAY, p. 158](#), the copy group is changed to **PAGON** after page 1 is printed. Because the constant overlay and page 1 were printed with the first two **PLACE** commands of copy group **PAGE1**, the third **PLACE** command in new copy group is used for the next page. Page 2 of statement 1 is placed in partition 2 front, as specified in the third **PLACE** subcommand of copy group **PAGON**.

After the fourth and last page of statement 1, the copy group is changed back to **PAGE1** to print page 1 of statement 2. Page 4 of statement 1 printed in front partition 1 using the first **PLACE** subcommand of copy group **PAGON**. **N_UP** selects the second **PLACE** subcommand of copy group **PAGE1**: **PLACE 1 FRONT**. But the **INVOKE** subcommand for copy group **PAGE1** specifies **BACK**. **N_UP** continues sequentially through the **PLACE** subcommands of copy group **PAGE1** until it finds a **BACK** partition. This is the third **PLACE** subcommand: **PLACE 1 BACK CONSTANT OVERLAY C**. The constant overlay is placed in partition 1 on the back of the sheet, then page 1 of the new customer's statement is printed using the next **PLACE** subcommand: **PLACE 2 FRONT** on the front side of the constant overlay.

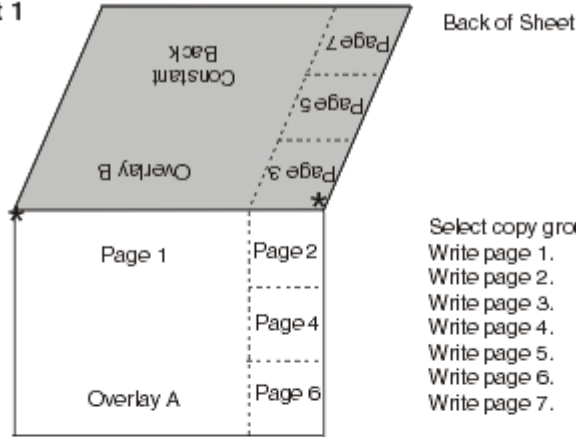

↓ Note

You can use **NEXT**, **FRONT**, or **BACK** on the **INVOKE** subcommand only when switching between copy groups that have identical medium modifications. This includes identical **N_UP** values and an identical number of **PLACE** subcommands. If the copy groups have different values, the **INVOKE** command causes an eject to a new physical sheet.

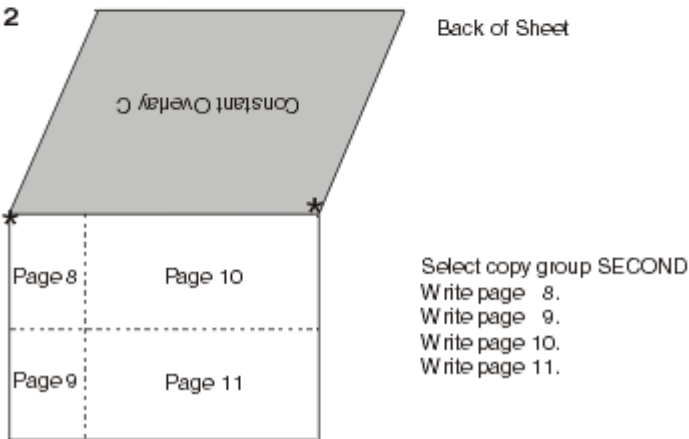

Enhanced N_UP Example 3: Asymmetric Pages

Enhanced N_UP Example 3: Asymmetric Pages

Sheet 1

Sheet 2

The previous figure shows the flexibility and power of enhanced **N_UP** printing. With enhanced **N_UP** printing, you can place pages relative to any partition on the sheet, front or back, in any sequence. Pages are not limited by partition boundaries. The only limitations are that pages must not print outside the physical form boundaries, and you cannot place more pages on a sheet than the number specified in the **N_UP** subcommand. For an **N_UP 4** duplex page, the limit is eight pages total on front and back sides combined. For **N_UP 3** duplex, the limit is six pages on the front and back combined.

↓ Note

In the duplex examples shown in the previous figure, all of the pages can be on one side, with the other side blank.

Form Definition for Enhanced N_UP Example 3

```
FORMDEF ASYMET DUPLEX NORMAL ;

COPYGROUP FIRST
PRESENT LANDSCAPE DIRECTION ACROSS
N_UP 4
/* Constant*/    PLACE 1 BACK  OFFSET  4  0  CONSTANT OVERLAY B
/* Page 1 */     PLACE 1 FRONT OFFSET  0  0  Overlay A
/* Page 2 */     PLACE 1 FRONT OFFSET 12  0
```

```

/* Page 3 */ PLACE 1 BACK OFFSET 0 0
/* Page 4 */ PLACE 1 FRONT OFFSET 12 4
/* Page 5 */ PLACE 1 BACK OFFSET 0 4
/* Page 6 */ PLACE 1 FRONT OFFSET 12 8
/* Page 7 */ PLACE 1 BACK OFFSET 0 8 ;

COPYGROUP SECOND
PRESENT PORTRAIT DIRECTION ACROSS
N_UP 3
/* Constant*/ PLACE 1 BACK OFFSET 0 0 CONSTANT OVERLAY C
/* Page 8 */ PLACE 1 FRONT OFFSET 0 0
/* Page 9 */ PLACE 1 FRONT OFFSET 0 4
/* Page 10 */ PLACE 1 FRONT OFFSET 6 0
/* Page 11 */ PLACE 1 FRONT OFFSET 6 4
/* 6th place */ PLACE 1 BACK OFFSET 0 0 CONSTANT ;

```

To achieve the asymmetrical page placement shown in this example, place all the pages relative to the origin of partition 1 on the front or the back side of the sheet. You can place the pages relative to the origin of any of the partitions, but using partition 1 simplifies the calculations for page positions.

With **N_UP 4**, the default **PORTRAIT** presentation and **ACROSS** direction place the origin at the top right of the partition on wide, continuous-form paper. In this example, specifying **LANDSCAPE ACROSS** sets the origin at the top-left corner, to achieve the correct page arrangement.

The coding of the form definition for example 3 is shown in the previous figure. Copy group **FIRST** specifies **N_UP 4**, which requires eight **PLACE** subcommands for the duplex page. Observe that the constant overlay B on the back of the sheet represents one of the eight **PLACE** subcommands. **COPYGROUP SECOND** used for the second sheet specifies **N_UP 3**. You must use six **PLACE** subcommands. Four pages are placed on the front side, and a constant overlay is placed on the back, using five of the six **PLACE** subcommands. A **CONSTANT** page is specified without an overlay to fill the sixth **PLACE** subcommand. Nothing is printed with this **PLACE** subcommand, but it is required to ensure a correct internal page count for recovery and restart.

Note

In each copy group, the **PLACE** subcommand for the constant overlay is placed in front of all the **PLACE** subcommands for page data. This placement ensures that the constant overlay prints if any pages are printed on the sheet. Otherwise, if you change copy groups or run out of pages before the **PLACE** command for the constant overlay, the overlay does not print.

Additional N_UP Considerations

N_UP can affect the scope of other PPFA commands that operate on a page or a medium.

COPIES

The **COPIES** subcommand in the **SUBGROUP** of the form definition operates on the physical medium. When you specify five copies using **N_UP 2**, you get five sheets of the **N_UP 2** data.

SUPPRESSION

The **SUPPRESSION** subcommand in the **SUBGROUP** of the form definition operates on the physical medium. The suppression names in the **SUBGROUP** operate on all **N_UP** pages on the sheet.

OVERLAY

You can specify an **OVERLAY** subcommand in multiple places in the form definition and can also specify an overlay in the page definition. The result is either a *page overlay* or a *medium overlay*. See [Medium Overlays and Page Overlays, p. 162](#) for a description of the differences between these commands and the uses of these overlays.

PRESENT DIRECTION

You use the **PRESENT** and **DIRECTION** subcommands of the form definition with the **N_UP** subcommand to determine partition arrangement. These commands, which are described in this update guide, now affect all **N_UP** printers, including cut-sheet printers.

CONDITION

You can use the **CONDITION** command of the page definition with **N_UP** just as you use it with non **N_UP** jobs. However, the **NEWSIDE** and **NEWFORM** parameters may operate differently than you expect. **NEWSIDE**, which is equivalent to invoking a new page format, ejects to the next partition, which may not be on a new side of an **N_UP** sheet. **NEWFORM**, which is equivalent to invoking a new copy group, ejects to a new sheet with basic **N_UP**. The effect with enhanced **N_UP** depends on the coding of the **INVOKE** subcommand.

Medium Overlays and Page Overlays

An AFP overlay can be used as a *page overlay* or as a *medium overlay*. Different actions are performed on these two different types of overlays. Page overlays apply to the page and are placed relative to the page origin. Medium overlays always apply to the entire medium and are placed at the medium origin. When used with **N_UP**, the medium overlay still applies to the entire sheet of paper, not to the individual partitions.

The same overlay can be either a page overlay or a medium overlay, depending on the method used to invoke it for printing. An overlay invoked by a page definition or by an Include Page Overlay (IPO) structured field is always a page overlay. An overlay invoked by a form definition without **N_UP** is always a medium overlay. When **N_UP** is specified in the form definition, you can specify commands to invoke a page overlay. The examples below show the ways in which overlays can be invoked.

Page Overlay Invoked by an IPO Structured Field

```
PAGEDEF EXMPL1 ;
PAGEFORMAT P2EXMPL1;
OVERLAY EXMPL1;      /* Allows this page overlay to be      */
                    /* invoked by an IPO structured field */
PRINTLINE REPEAT 60; /* coded in the print data          */
```

Page Overlay Invoked by a PRINTLINE Command

```
PAGEDEF EXMPL2 ;
PAGEFORMAT P2EXMPL2;
OVERLAY EXMPL2;      /* Optional. Stores overlay for reuse */
PRINTLINE REPEAT 1
  POSITION 1 IN 1 IN
  OVERLAY EXMPL2     /* Prints overlay if data prints on printline */
  -1 IN -1 IN ;     /* Positions overlay relative to printline */
PRINTLINE REPEAT 50;
```

Medium Overlay Invoked by a Form Definition

```
FORMDEF EXMPL3 ;
COPYGROUP F2EXMPL3
DUPLICATE NORMAL ;
OVERLAY XMPL3F; /* Allows SUBGROUP to invoke overlay */
OVERLAY XMPL3B; /* Allows SUBGROUP to invoke overlay */
SUBGROUP FRONT
OVERLAY XMPL3F; /* Prints overlay on front of every form */
SUBGROUP BACK
OVERLAY XMPL3B; /* Prints overlay on back of every form */
```

Page Overlay in a Simple N_UP Form Definition

```
FORMDEF EXMPL4 ;
COPYGROUP F2EXMPL4
N_UP 2
OVERLAY EXMPL4 /* Prints overlay with page in every */
0 0 ; /* Partition at the page origin (0,0) */
```

Page Overlay in an Enhanced N_UP Form Definition

```
FORMDEF EXMPL5 ;
COPYGROUP F2EXMPL5
N_UP 2
PLACE 1
OVERLAY XMPL51 /* Prints overlay in Partition 1 */
0 0 PARTITION /* Places it relative to Partition */
PLACE 2
OVERLAY XMPL52 /* Prints overlay in Partition 2 */
0 0 PARTITION ; /* Places it relative to Partition */
```

N_UP Compared to Multiple-Up

With the addition of the **N_UP** capability, AFP now provides two methods to format multiple application pages on a single sheet:

- **N_UP** as defined in a form definition
- Multiple-up as defined in a page definition

The multiple-up function has long been available for line-format data printed on AFP printers. Multiple-up achieves the *appearance* of multiple pages on a sheet by formatting multiple groups of print lines as a single AFP page. The output is still a single AFP page on a side of a sheet, and the entire output is formatted by a single page format. If the application pages within that sheet require different print layouts, you must design a different page format for all possible arrangements of data. For example, if one side of a 2-up sheet has ten different print layouts, you need 100 different page formats to cover all the possible combinations.

In contrast, **N_UP** enables you, for the first time in AFP, to place *multiple AFP pages* on a side of a sheet. This means that each of the **N_UP** pages can be formatted using a different page format. You can change page formats between each **N_UP** page without ejecting to a new side of the sheet. For the same example with **N_UP**, you need only ten page formats for a 2-up sheet with ten different print layouts.

N_UP also means you can place multiple pages of fully-composed AFP data (or MO:DCA data) on a single sheet. This was not possible using the multiple-up function defined in the page definition, because AFP data does not use a page definition.

AFP Color Management

There are various ways to print color data with Advanced Function Presentation (AFP). However, to implement an AFP color printing solution with full color management, you must use color management resources (CMRs). We also recommend that you install all your color images as data objects and associate CMRs with them.

Color Management Resources

Color management resources (CMRs) are the foundation of color management in AFP print systems. They are AFP resources that provide all the color management information, such as ICC profiles and halftones, that an AFP system needs to process a print job and maintain consistent color from one device to another.

CMRs share some characteristics with other AFP resources, but are different in some important ways.

CMRs are similar to other AFP resources in these ways:

- CMRs can be associated with elements of a print job at various levels of the hierarchy. Typical hierarchy rules apply, so CMRs specified at lower levels override those at the higher level. For example, a CMR set on a data object overrides a default CMR set on a print file.
- CMRs can be included in a print job in an inline resource group and referenced in a form definition, page environment, object environment, or an include Object (IOB) structured field.

Note

- CMRs can vary in size from several hundred bytes to several megabytes. If your print job uses relatively few CMRs, including them in the print file might not have an impact on the performance of your system. However, if your print job uses more than 10 CMRs, the size of the print job can increase so much that file transfer rates and network traffic are affected.
- CMRs can be stored centrally in a resource library, so you do not need to include them in every print job. You can configure all your print servers so they can access the CMRs.
- For the print server to find CMRs, the resource library must be listed in the AFP resource search path on the print server.

CMRs are different from other AFP resources in these ways:

- You cannot copy CMRs into a resource library as you can other AFP resources. To store CMRs in a central resource library, you must install them by using an application such as RICOH AFP Resource Installer.
- CMRs and data objects must be stored in resource libraries that have resource access tables (RATs). AFP Resource Installer creates the RAT when CMRs and data objects are installed. We recommend that CMRs and data objects be installed in separate resource libraries and that you store resources

that do not require RATs (such as form definitions, page definitions, and overlays) in other resource libraries.

- CMRs installed in a resource library can have names longer than 8 characters, and you can use the names in the print data stream.

These names are created when you install the CMR by using AFP Resource Installer and are UTF-16BE encoded.

Types of CMRs

2

Different situations call for different types of CMRs. Some CMRs are created by product manufacturers so you can download and use them, while others are created by your printer or other color management software. If you have the appropriate information, you can also create CMRs yourself.

Some CMRs are used to interpret input files (similar to the function performed by ICC input profiles), while others are used to prepare the final print job output for a specific printer (similar to the function performed by ICC output profiles).

Color Conversion CMRs

Color conversion (CC) CMRs are used to convert colors to and from the ICC profile connection space (PCS), a device-independent color space. You can use them to prepare images for color or grayscale printing.

Color conversion CMRs are an essential element of any AFP color management system because they are ICC profiles encapsulated in AFP structures. The AFP structures add information that your color management system can use, but it leaves the ICC profile unaltered.

You can use color conversion CMRs to produce consistent colors on different devices. In a color system, they help ensure that the colors on your monitor are as close as possible to those that are printed. If you move the print job to a different printer, the colors are adjusted again to match the new printer.

In a grayscale system, color conversion CMRs map colors to appropriate shades of gray to produce high-quality black and white images.

Passthrough CMRs are color conversion CMRs that indicate that no color processing should be done if the color space of the presentation device is the same as the color space of the CMR. Passthrough CMRs contain no data.

Link Color Conversion CMRs

Link color conversion CMRs combine the processing information required to convert an image directly from the color space of an input device to the color space of the output device. Essentially, link color conversion CMRs replace a pair of color conversion CMRs.

Converting color images to and from the PCS takes a significant amount of processing resources, in part because the process includes two conversions. Link color conversion CMRs combine the two conversions and make them more efficient. The printer can use the link color conversion CMR to convert colors directly from the color space of the input device to the color space of the output device with the same color fidelity they would have if the printer did both of the conversions. As a result, link color conversion CMRs can improve system performance.

The two types of link color conversion CMRs are:

Link CMRs

Link (LK) CMRs are unique. You cannot create a link CMR yourself and you do not include references to link CMRs in your print jobs. The print system creates and uses link CMRs automatically.

If you use AFP Resource Installer, link CMRs are generated automatically when you create or install a color conversion CMR. As a result, your resource library always contains link CMRs for every combination of color conversion CMRs in audit (input) and instruction (output) processing modes. When link CMRs are created, AFP Resource Installer marks them as *capturable*, so the printer can save them to be used in other print jobs.

If you do not use AFP Resource Installer, some printers can create link CMRs when they process print jobs. Then, the print controller looks at the link CMRs that it has available to find one that combines the audit color conversion CMR with the appropriate instruction color conversion CMR. If it does not find one, the print controller creates the link CMR and uses it. The print controller can be configured to save the link CMRs that it creates. However, the link CMRs are sometimes removed during normal operation, for example, if the printer runs out of storage or is shut down. If the link is removed, the printer must create a new link CMR the next time it is needed.

When a link CMR is created, the print system evaluates the conversion algorithms to and from the PCS. The system then combines the algorithms, so a data object can be converted directly from one color space to the other without actually being converted to the PCS.

Device link CMRs

Device link (DL) CMRs use an ICC device link profile to convert directly from an input color space to an output color space without reference to an audit-mode or instruction-mode CMR. An ICC device link profile is a special kind of ICC profile that is used to convert the input device color space to the color space of an output or display device. ICC device link profiles are not embedded in images.

You can create, install, and uninstall device link CMRs yourself. Device link CMRs are referenced in the MO:DCA data stream and take precedence over audit color conversion CMRs. A device link CMR specifies its own rendering intent, which is indicated in the header of the ICC device link profile. This rendering intent overrides any other rendering intent that is active.

The biggest advantage of using device link CMRs is that they preserve the black channel (K component) of the input color space when converting from CMYK to CMYK.

Halftone CMRs

Halftone (HT) CMRs carry the information that a printer uses to convert print jobs into a pattern of dots that it can put on paper. Halftone CMRs can be used with both color and grayscale print jobs.

Halftone CMRs generally specify the line screen frequency, halftone pattern, and rotation of the halftone that they carry. Some device-specific halftone CMRs also include the printer resolution.

A printer that uses AFP color management to print color or grayscale print jobs must use a halftone CMR to convert the print job into a format that the printer can reproduce in ink or toner. If a halftone CMR is not specified in the print job, the printer applies a default halftone CMR.

You can associate device-specific halftone CMRs or generic halftone CMRs with print jobs:

- If you know which printer is printing the job, you can associate a device-specific halftone CMR with the print job (or with AFP resources inside the print job). The printer uses the halftone CMR that you specify.

- If you do not know which printer is printing the job, but you want to ensure that it uses a halftone CMR that has certain characteristics, such as a specific line screen frequency, you can associate a generic halftone CMR with the print job.

Because it is difficult to know which halftone CMRs should be used for the current conditions on the current printer, we recommend that you specify halftone CMRs generically and let the printer choose the most appropriate CMR that it has available.

Generic halftone CMRs

You can use generic halftone CMRs when you want to choose one or more characteristics of the halftone CMR for a print job, but you do not know exactly which halftone CMRs are available.

When a print job specifies a generic halftone CMR, the print server looks in the resource library for halftone CMRs that match the printer device type and model. If the print server finds an appropriate CMR, it sends the device-specific halftone CMR to the printer with the print job. If the print server does not find an appropriate halftone CMR, it sends the generic halftone CMR to the printer.

If a print job arrives at the printer requesting a generic halftone CMR, the printer compares the requested characteristics with the available device-specific halftone CMRs. If there is a match, the printer uses the selected device-specific halftone CMR when it processes the print job. If there is no match, the printer uses the halftone CMR whose line screen frequency value is closest to the one requested.

The Color Management Object Content Architecture (CMOCA) has defined a variety of generic halftone CMRs, which cover the most common line screen frequencies and halftone types. A print server that supports CMOCA can interpret generic halftone CMRs if it has device-specific halftone CMRs available to it in a resource library. If you use AFP Resource Installer, the generic halftone CMRs are installed in every resource library that you create and populate by using AFP Resource Installer.

Printers that support CMOCA should be able to interpret those generic CMRs and associate them with device-specific halftone CMRs.

Tone Transfer Curve CMRs

Tone transfer curve (TTC) CMRs are used to carry tone transfer curve information for an AFP print job, so you can modify the values of a particular color component and adjust the appearance of some of the colors by increasing or decreasing the amount of ink used to emphasize or reduce the effects of dot gain on the final output.

Like halftone CMRs, tone transfer curve CMRs are associated with print jobs specifically or generically. If they are specified generically, the print server looks in the resource library for tone transfer curve CMRs that match the printer device type and model. If the print server finds an appropriate CMR, it sends the device-specific tone transfer curve CMR to the printer with the print job. If the print server does not find an appropriate tone transfer curve CMR, it sends the generic tone transfer curve CMR to the printer.

If a print job arrives at the printer requesting a generic tone transfer curve CMR, the printer compares the requested characteristics with the device-specific tone transfer curve CMRs that it has available. If there is a match, the print server or printer uses the selected device-specific tone transfer curve CMR when it processes the print job. If the printer cannot find a good match for the generic tone transfer curve CMR, it ignores the request and uses its default tone transfer curve CMR.

The Color Management Object Content Architecture (CMOCA) defines several generic tone transfer curve CMRs with different appearance values. You can use the appearance values to specify how to print your job with regard to the reported dot gain of the printer.

Generic tone transfer curves can be used to select these appearance values:

Dark

The output is adjusted to show a dot gain of 33% for a 50% dot.

Accutone

The output is adjusted to show a dot gain of 22% for a 50% dot.

Highlight Midtone

The output is adjusted to show a dot gain of 14% for a 50% dot. This appearance is often used to emphasize the brightest part of an image.

Standard

The output is adjusted just enough to account for the effects of dot gain, effectively counteracting the dot gain.

If you use AFP Resource Installer, it installs the generic tone transfer curve CMRs on your system automatically.

CMR Processing Modes

CMR processing modes tell the print system how to apply a CMR to the print data it is associated with. You specify a CMR processing mode whenever you specify a CMR, although not all modes are valid for all CMR types.

Audit Processing Mode

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the profile connection space (PCS).

For example, to take a photograph with a digital camera and then include the photograph in an AFP print job, you can use AFP Resource Installer to:

1. Create a color conversion CMR by using the ICC profile of your camera.
2. Install your photograph in a resource library.
3. Associate the color conversion CMR with the data object, indicating the audit processing mode.

Then, you create a print job that includes the data object. When processing the print job, the system uses the color conversion CMR to convert the colors in the image into the PCS. The colors can then be converted into the color space of the printer that is printing it.

Instruction Processing Mode

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer that uses a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a CD, or available for download from the manufacturer's Web site.

If you send a color AFP print job to a printer that supports AFP Color Management, color conversion and tone transfer curve CMRs in instruction processing mode can be associated with the job. When the printer processes the print job, it applies the CMRs in this order:

1. Color conversion CMRs in audit processing mode to convert the resources into the ICC profile connection space (PCS).
2. Color conversion and tone transfer curve CMRs in instruction processing mode to convert the resources into the color space of the printer.
3. Halftone CMR in instruction processing mode to convert the job pages from their digital format into the pattern of dots that the printer can produce.

In some cases, CMRs that are usually used as instruction CMRs can be used as audit CMRs. For example, if you send a very large print job to a high-speed printer, the images in the print job are converted into the color space of that printer by using a color conversion CMR with the instruction processing mode. However, if you have to reprint part of the job on a different printer, the system must convert the print job into the color space of the second printer. In that case, the color conversion CMR of the first printer is used in the audit processing mode to move the images back into the PCS. Then, the system uses a color conversion CMR of the second printer in instruction mode to convert the images into its color space.

Link Processing Mode

CMRs with the link processing mode are used to link an input color space in the presentation data (sometimes defined by an audit CMR) to the output color space of the presentation device (sometimes defined by an instruction CMR). Only link (LK) and device link (DL) CMRs can be used in link processing mode.

Whenever you install or uninstall audit or instruction color conversion CMRs in your resource library by using AFP Resource Installer or a similar software product, the AFP Resource Installer automatically creates or deletes link (LK) CMRs for every combination of audit and instruction color conversion CMR.

When a print job calls for a given audit-instruction combination, the print server checks the resource library for a link (LK) CMR for that combination. If the print server finds an appropriate link CMR, it sends the CMR to the printer with the print job. Your printer can use the link (LK) CMRs whenever a print job indicates that it uses a particular combination of audit and instruction CMRs.

If you do not use AFP Resource Installer or a similar program to install your resources, your color printer must either create link (LK) CMRs while it processes your print jobs or convert the colors in your jobs twice, first from the original color space to the PCS and then from the PCS to the color space of the printer.

CMR Creation and Installation

Device manufacturers and groups that support AFP color standards create CMRs that you can use in your color printing systems. You can also create CMRs yourself, based on your needs.

The AFP Consortium, the group that defined the AFP Color Management Object Content Architecture (CMOCA), identified a set of color conversion CMRs that are most often used in audit processing mode. The set includes color conversion CMRs for common color spaces, such as:

- Adobe RGB (1998)
- sRGB
- SMPTE-C RGB
- SWOP CMYK

The standard CMRs are included with AFP Resource Installer, although they are not installed by default. You can install the standard CMRs that you plan to use. In addition, AFP Resource Installer automatically installs all the generic halftone and tone transfer curve CMRs in any resource library you create.

If you need more CMRs, you can create them by using wizards provided in AFP Resource Installer. See the online help for details about the wizard.

If you use AFP Resource Installer to create a CMR, the software automatically installs the CMR in a resource library. You can also use AFP Resource Installer to install CMRs that you get from your printer manufacturer.

Data Objects

Presentation data objects contain a single type of data (such as GIF, JPEG, and TIFF images) and can be used in your print jobs. These data objects can be placed directly in a page or overlay or can be defined as resources and included in pages or overlays. Using a data object as a resource is more efficient when that object appears more than once in a print job; resources are downloaded to the printer just once and referenced as needed.

Data objects can either be included inline with a print job or installed in a resource library by using software such as AFP Resource Installer. If you install your data objects in a resource library, you can associate color conversion CMRs with them.

Types of Data Objects

Image data objects can be stored in a number of different formats, including AFPC JPEG Subset, EPS, GIF, IOCA, PDF, PNG, and TIFF. These image types are device-independent so they can be used by different systems and still be interpreted consistently.

- AFPC JPEG Subset (JPEG)
AFPC (AFP Consortium) JPEG Subset files, formerly called JPEG File Interchange Format (JFIF) files, are bitmap image files that are compressed by using Joint Photographic Experts Group (JPEG)

compression. As a result, AFPC JPEG Subset files are most commonly referred to as JPEG files. JPEG files most commonly use the file extension .jpg, but can also use .jpeg, .jpe, .jfif, and .jif.

JPEG compression deletes information that it considers unnecessary from images when it converts them. JPEG files vary from having small amounts of compression to having large amounts of compression. The more an image is compressed, the more information is lost. If the image is compressed only once, there usually is no noticeable effect on the image. However, if the image is compressed and decompressed repeatedly, the effects of deleting information become more noticeable.

JPEG compression is commonly used for photographs, especially photographs that are transmitted or displayed on Web pages. The compression makes the files small enough to transmit on a network efficiently, but leaves enough information that the image is still visually appealing.

- **Encapsulated PostScript (EPS)**
EPS is a PostScript graphics file format that follows conventions that Adobe Systems defined. EPS files support embedded ICC profiles.
- **Graphics Interchange Format (GIF)**
GIF files are bitmap image files that are limited to a palette of 256 RGB colors. Because of the limited color range that it can contain, GIF is not a good format for reproducing photographs, but it is generally adequate for logos or charts. GIF images are widely used on the Internet because they are usually smaller than other image formats. GIF files use the file extension .gif.
- **Image Object Content Architecture (IOCA)**
IOCA is an architecture that provides a consistent way to represent images, including conventions and directions for processing and exchanging image information. The architecture defines image information independently of all data objects and environments in which it might exist and uses self-identifying terms; each field contains a description of itself along with its contents.
- **Portable Document Format (PDF)**
PDF is a standard file format that Adobe Systems developed.

PDF files can be used and stored on various operating systems and contain all the required image and font data. Design attributes in a PDF are kept in a single compressed package.

Note

- Single-page and multiple-page PDF files can be used as data objects in AFP print jobs.

- **Portable Network Graphics (PNG)**
PNG files are bitmap image files that support indexed colors, palette-based images with 24-bit RGB or 32-bit RGBA colors, grayscale images, an optional alpha channel, and lossless compression. PNG is used for transferring images on the Internet, but not for print graphics. PNG files use the file extension .png.
- **Tagged Image File Format (TIFF)**
TIFF files are bitmap image files that include headers to provide more information about the image. TIFF files use the file extensions .tif or .tiff.

TIFF files support embedded ICC profiles. If an ICC profile is embedded in a file, the characteristics of the input color space are known whenever the file is used; however, the profiles increase the file size. When you save a file in the TIFF format, you can use various compression algorithms.

Note

- Single-image and multiple-image TIFF files can be used as data objects in AFP print jobs.

Not all printers support all types of data objects.

The embedded ICC profiles in EPS, JPEG, and TIFF files contain the information that a printer uses to convert colors in the image from an input color space into the profile connection space (PCS). The input color space is either an industry-standard space or a custom space that describes the color reproduction capabilities of a device, such as a scanner, digital camera, monitor, or printer.

Data Object Creation and Installation

2

You can use a wide variety of software applications to create or manipulate images to include in print jobs. If you want to store them in central resource repositories, you can use AFP Resource Installer to install them.

Data object creation

Most types of data objects are images of some kind. Examples include: photographs taken with a digital camera; charts or diagrams generated by a software tool; and digital drawings created using graphics software. Regardless of how images are created, you generally need to manipulate them to include them in print jobs.

The changes include:

- Convert the image into a file type that is appropriate for printing. For example, the file types that many graphics applications (such as Adobe Illustrator, CorelDRAW, and Corel Paint Shop Pro) use to store images while you work on them are not appropriate for printing. To use images that you create from any of those programs, you can save or export those files as a different file type, such as EPS, JPEG, or TIFF.
- Make sure that your image files are associated with an appropriate color space or input profile. Follow the instructions provided with your graphics software to set up color management, including installing and using ICC profiles for digital cameras and monitors, and customizing color management settings. The instructions should also explain how to change the color profile that an image uses and how to save an image with an embedded profile.
- Follow the tips and best practices provided in the other sections below for creating images and managing them as data object resources.

Data object installation

You can use AFP Resource Installer to install your images in a resource library. AFP Resource Installer includes wizards that can guide you through the process of installing an image as a data object. When you install an EPS, JPEG, or TIFF image with an embedded ICC profile by using AFP Resource Installer, you can choose how you want to handle the profile:

- Leave the profile in the file without creating a CMR.
- Leave the profile in the file, but also copy the profile and create a CMR from the copy. Associate the new CMR with the data object.
- To reduce the file size, remove the profile from the file and make the profile into a CMR. Associate the new CMR with the data object.

Resource Library Management

If you store CMRs and data objects in central resource libraries, you must understand some of the characteristics of resource libraries to make sure that your resources are available when and where you need them.

Resource libraries that AFP Resource Installer creates use a *resource access table* (RAT) as the index of the resource library. The index is stored as a file in the library that it refers to. You must store CMRs in resource libraries that use a RAT. We recommend that you store data objects in resource libraries that use a RAT as well.

When you use AFP Resource Installer to create a resource library, it creates a RAT and stores it in the library. When you install a CMR or data object, AFP Resource Installer updates the RAT with information about the resource. When a print server looks in a resource library for a resource, it first looks in the RAT to see if the resource is listed.

The print server relies on the RAT; if it is incorrect, the print server cannot find resources in the resource library. As a result, you must always use AFP Resource Installer to manage your resource libraries, including to:

- Add CMRs and data objects to a resource library.
Do not copy CMRs or data objects directly into the resource libraries that AFP Resource Installer uses. If you copy CMRs or data objects into these resource libraries, the RAT is not updated so the print server cannot use it to find the CMRs or data objects.
- Modify properties of data objects and CMRs listed in the RAT.
Do not directly edit the RAT or any of the files in a resource library. Do not replace an existing version of a CMR or data object with a new version by copying the new version directly into the resource library; use AFP Resource Installer to update the resource.
- Install CMRs or data objects in a different resource library or replicate a resource library in a different location.
Do not copy CMRs or data objects from a resource library and store them in another location.

For more information about completing these tasks, see the AFP Resource Installer online help.

Tips and Best Practices

These general guidelines about creating and managing images and other color resources can improve the performance of your AFP color printing system.

Tips for images

To optimize the performance of your AFP color printing system, we recommend that you follow some guidelines for creating and including images in print jobs.

When you want to use color images in your print jobs:

- Get the original electronic versions of images instead of scanning existing documents.

Almost unnoticeable specks of color in the background of images that have been scanned can greatly increase the size of the image. If you must scan an image, use an image editing tool to clean up the background as much as possible.

- Save all images in the same standard color space so you only need one input profile for all of them. Adobe RGB (1998) is the recommended color space for images that are to be printed.
- Flatten multi-layer images (such as the ones you can create in graphics tools like Adobe Illustrator and Corel Paint Shop Pro) before including them in print jobs. Unflattened images are extremely large and more difficult to work with. Save a copy of the original image for future editing, but flatten the version that you include in your print job.

Tips for Resources

To optimize the performance of your AFP color printing system, we recommend that you follow some guidelines for managing color resources.

You can use AFP Resource Installer to:

- Install all the CMRs for your printer in a resource library.
- Install the data objects that you use frequently in a resource library.
- Mark the CMRs and data objects that are reused regularly as non-private, capturable resources so they can be saved on the printer and used for other print jobs without being downloaded every time.

Note

- This option is not advisable for secure resources, such as signature files.
- Install CMRs and data objects in resource libraries that the print server can access, so they only need to be stored in one place and can be used by all print servers.
- Associate audit color conversion CMRs with data objects that require color management, so the embedded profiles can be removed from the image files.

CMRTAGFIDELITY Subcommand (FORMDEF)

The following subcommand on the **FORMDEF** command describes the exception, continuation and reporting rules for Color Management Resource (CMR) tag exceptions. A CMR tag exception is detected when an unsupported CMR tag is encountered in a CMR. Having CMR tag fidelity allows additional CMR tags to be added in the future without necessarily causing exceptions in printers that do not support the new tags.

CMR Tag Fidelity

```
FORMDEF
:
[CMRTAGFIDELITY {STOP | CONTINUE [NOREPORT | REPORT]}]
```

FORMDEF

The full form definition command and all its other non-CMR subcommands are described in [FORMDEF Command, p. 235](#).

CMRTAGFIDELITY

Specify the exception continuation and reporting rules for Color Management Resource (CMR) tag exceptions.

STOP

CMR Tag exception rule is "Stop presentation at point of first CMR tag exception and report the exception".

CONTINUE

CMR Tag exception rule is "Do not stop presentation because of CMR tag exceptions and do one of the following:"

NOREPORT

Do not report the CMR tag exception to the print server. This is the default if neither **NOREPORT** or **REPORT** is coded.

REPORT

Report the CMR tag exception.

Code Example

In the following example, if there is a CMR tag exception, processing will continue and the printer will report the exception to the print server.

```
FORMDEF cmrXm1 REPLACE yes CMRTAGFIDELITY continue report;
```

DEFINE CMRNAME Subcommand (FORMDEF and all PAGEDEF types)

```
DEFINE cmr-lname CMRNAME { 'cmr-name' | X16 'cmr-name' }
```

DEFINE CMRNAME

This command defines a CMR name. A CMR is identified with a name that is specified in a CMR resource object. The name is 73 characters and is based on an architected naming scheme to ensure uniqueness. This naming scheme includes field components such as CMR type, manufacturer, device type, device model number, and so forth. CMR names are fully described in the *Color Management Object Content Architecture Reference* manual.

Subcommands

cmr-lname

CMR local name. Specify a local name with up to 16 characters. This name is used to reference a CMR with a short user specified name. After defining the CMR name with a local name, it can be used on CMR commands and subcommands.

↓ Note

This local name must be unique throughout the entire PPFA source file. That is, the local name cannot be reused in **DEFINE CMRNAME** commands that appear in different form definitions and/or page definitions if they are in the same source file.

'*cmr-name*'

Specify the full 73-character CMR name. The name is entered as single byte characters and will be translated to UTF-16BE. The *cmr-name* must match exactly the name specified for this CMR in the Resource Installer. See [How to Copy and Paste a Name from the AFP Resource Installer, p. 177](#) for more information.

↓ Note

When doing the translation, PPFA uses a fixed table. That is it only translates from:

- EBCDIC code page 500, when run on z/OS systems
- ASCII code page 819, when run on Windows systems

X16 '*cmr-name*'

Specify the full CMR name as UTF-16 hex digits. The name is entered in its UTF-16BE encoding, which takes 4 hex digits per character. No translation is needed.

Code Example

In the following example, there are three defined CMR names.

- Local name "bm1" is defined with a 73-character name in single quotes and no text type. The name will be translated into UTF-16BE. The example shows the name being split over 3 PPFA source lines which may be necessary because of source input record length. The character string can be copied-and-pasted from the AFP Resource installer. See the section titled [How to Copy and Paste a Name from the AFP Resource Installer, p. 177](#).
- Local name "jm4" is specified with X16 data type. This means that the name will be entered in UTF-16BE hexadecimal digits.
- Local name "gen1dark" is a generic CMR. This is one of the registered generic CMRs. It is entered within single quotes which basically says it is coded with characters and will be translated to UTF-16BE.

CMR "bm1" is defined for the entire print file. It will be used to render color for all color resources in the print file unless overridden by a CMR with a more restricted scope. Below **COPYGROUP "cg1"** uses CMR "bm1" because it inherits from the form definition. Copygroup "cg2" will use CMR "jm4" and copygroup "cg3" will use CMR "gen1dark" to render color resources for the groups of pages they control.

Example

```
FORMDEF cmrX12 REPLACE yes;
DEFINE bm1 CMRNAME
    'BillMay4HT001.200IBM@@4100@@'
    'PD194@whtg190@2@@@@@rnd@@@141@600@'
    'proc@@@@@@@@' ;

DEFINE jm4 CMRNAME
X16 '004A006F0068006E004D006100790034' /* JohnMay4 */
```

```

'00480054' /* HT */
'003000300031002E003200300030' /* 001.200 */
'00490042004D00400040' /* IBM@@ */
'003400310030003000400040' /* 4100@@ */
'005000440031' /* PD1 */
'003900340040' /* 94@ */
'007700680074' /* wht */
'0067006C' /* gl */
'003900300040' /* 90@ */
'00320040004000400040' /* 2@@@ */
'0072006E0064004000400040' /* rnd@@@ */
'0031003400310040' /* 141@ */
'0036003000300040' /* 600@ */
'00700072006F0063' /* proc */
'0040004000400040004000400040' /* @@@@@@@@@@ */
;

DEFINE gen1dark CMRNAME
'@@@@@@@@TCgeneric@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
'dark@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@' ;

CMR bm1 PRINTFILE INSTR;

COPYGROUP cg1 ;

COPYGROUP cg2 ;
CMR jm4 INSTR;

COPYGROUP cg3 ;
CMR gen1dark INSTR;

```

How to Copy and Paste a Name from the AFP Resource Installer

Here are the steps that the user must take to copy and paste the CMR name from the AFP Resource Installer:

1. On your workstation, start the AFP Resource Installer
2. Use the Select menu item in the Library menu on the menu bar to open the server resource library where the CMR resides. The server resource library will appear in the top pane of the AFP Resource Installer.
3. Select the server resource library in the top pane and use the Expand Selected menu item in the Views menu on the menu bar to show the CMRs that reside in the server resource library.
4. Select the CMR.
5. Use the Properties menu item in the Actions menu on the menu bar to open the Properties notebook for the selected CMR.
6. Copy the CMR Name shown in the Properties notebook.
7. Paste the CMR Name into the PPFA source code.

Note

You may have to break the name up if you are using a platform that restricts the input source line length to less than 73. For example PPFA on z/OS restricts the input line to 72 bytes. In the PPFA code example below, the name is split over two lines with 42 and 31 characters each. In this case you would first copy the first 42 bytes of the name and paste them into line one, and then copy the remaining 31 bytes of the name into the second line.

2

Registered Generic Halftone CMRs

The following example is the Registered Generic Halftone CMRs. In a softcopy version of this publication, you may copy and paste the appropriate lines from this example into PPFA where you would use DEFINE CMRNAME.

Generic Halftone CMRs

```

```

CMR Subcommand (FORMDEF)

CMR Command

```
CMR cmr-lname {PRINTFILE | document_number} {AUDIT | INSTR | LINK};
```

CMR

Specify a Color Management Resource (CMR), its scope, and its process mode to be associated with the entire print file or a specific document in the print file.

Multiple CMR commands are allowed in the form definition.

Parameters

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

scope parameter

Specify whether the CMR is for the entire print file or a specific document in the print file. This parameter must immediately follow the cmr local name (*cmr-lname*).

PRINTFILE

The scope of this CMR is the entire print file.

document_number

The scope of this CMR is the specified document.

processing mode parameter

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs. The PPFA command RENDER is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

Code Example

In the following example, assume the **DEFINE CMRNAME** commands define the **CMR** names with local names (see the **DEFINE CMRNAME** command for more details).

Two **CMR**s are defined/associated:

1. The first **CMR** with local name "Picto550" is an audit CMR for a Picto camera and is to be associated with the entire print file.
2. The second **CMR** named "dark2" is a generic instruction CMR for the 5th document in the print file.

Example

```
DEFINE Picto550 CMRNAME
    'Pict1550CC001.001PictV550@@'
    'ES1@@@@@@@@@@@@@spac@@@@@@@@@@@@@RGB@'
    'XYZ@@@@@@@@@@@' ;
DEFINE dark2 CMRNAME
    '@@@@@@@@TCgeneric@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
    'dark@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@' ;

FORMDEF cmrXm2 REPLACE yes;
CMR Picto550 PRINTFILE audit;
CMR dark2 5 instr;
COPYGROUP cg1;
```

RENDER Subcommand (FORMDEF)

RENDER Command

```
RENDER {PRINTFILE | document_number}
[{{IOCA | OBJC | PTOCA | GOCA} {PERCEPTUAL | SATURATION | RELCM |
ABSCM}}... [DEFAULT | MONOCH] ;
```

RENDER

Specify the rendering intent (RI) and device output appearance for a print file or individual document.

RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC). For more information on RI see the current level of the ICC Specification. Multiple **RENDER** commands are allowed in the form definition so long as they are for different scopes.

Device output appearance specifies the appearance to be assumed by the presentation device (printer).

Parameters

scope parameter

Specify whether the rendering intent is for the entire print file or a specific document in the print file. This parameter must immediately follow the **RENDER** keyword.

PRINTFILE

The scope of this RI is the entire print file.

document_number

The scope of this RI is the specified document.

object type parameter

Specify the object type to which the following rendering intent parameters applies. Object type and rendering intent parameter pairs may be repeated to define RI for all object types.

IOCA

The following rendering intent applies to all IOCA objects in the print file or specified document.

OBJC

The following rendering intent applies to all non-OCA object containers in the print file or specified document.

PTOCA

The following rendering intent applies to all PTOCA objects in the print file or specified document.

GOCA

The following rendering intent applies to all GOCA objects in the print file or specified document.

rendering intent parameter

Specify the rendering intent for the preceding object type.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

device output appearance parameter

Specify one of a set of architected appearances to be assumed by the presentation device.

DEFAULT

Default appearance. The device assumes its normal appearance. For example, the default appearance of a process-color printer would be to generate full color output.

MONOCH

Monochrome appearance. The device assumes a monochrome appearance such that the device's default color is used for presentation. The device can simulate color values with gray scale using the default color, or it can simulate color values by simply substituting the default color, or it can use some combination of the two.

Code Example

In the following example, there are four **RENDER** subcommands defined. Note that multiple **RENDER** subcommands for the same scope are not allowed:

1. The first **RENDER** is for the entire print file, and defines the RI for IOCA objects as perceptual. It also specifies the device output appearance to be monochromatic.
2. The second **RENDER** is for the document 5, and defines the RI for non-OCA objects as saturation. It also specifies the device output appearance to be the device default which will mean full color output for a color printer.
3. The third **RENDER** is for the document 7, and defines the RI for PTOCA objects as media-relative colorimetric. No device output appearance is specified.
4. The fourth **RENDER** is for the document 9, and defines the RI for all supported objects. It also specifies the device output appearance to be monochromatic.

Example

```
FORMDEF cmrXm3 REPLACE yes;
  RENDER PRINTFILE IOCA perceptual MONOCH ;
  RENDER 5 OBJC saturation DEFAULT;
  RENDER 7 PTOCA relcm ;
  RENDER 9 OBJC abscm IOCA relcm PTOCA satur GOCA percp MONOCH;
COPYGROUP cg1;
```

CMR Subcommand (COPYGROUP)

CMR Command

```
CMR cmr-lname {AUDIT | INSTR | LINK} ;
```

CMR

Specify a Color Management Resource (CMR) and its process mode for the collection of pages defined by a **COPYGROUP**. The command is to be placed after the **COPYGROUP** command for which it is intended.

Multiple CMR commands are allowed in the form definition.

Parameters

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

processing mode parameter

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs. The PPF command **RENDER** is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

Code Example

The following example shows two copy groups with defined CMRs.

- Copygroup "picto" defines a CMR for presenting digital pictures taken with a Picto camera (an audit CMR), and a generic instruction CMR that will be replaced with a device-specific CMR or the default printer CMR.
- Copygroup "snap" defines a CMR for presenting digital pictures taken with a Snap camera (an audit CMR), and a generic instruction CMR that will be replaced with a device-specific CMR or the default printer CMR.

Example

```
FORMDEF cmrX13 REPLACE yes;
DEFINE Picto550 CMRNAME
        'Pict1550CC001.001PictV550@'
```

```

        'ES1@@@@@@@@@@@@@spac@@@@@@@@@@@@@RGB@'
        'XYZ@@@@@@@@@@@' ;
DEFINE snap1    CMRNAME
                'SnapDSC@CC001.001SNAP@DSC-R1'
                'CS@@@@@@@@@@@@@spac@@@@@@@@@@@@@RGB@'
                'XYZ@@@@@@@@@@@' ;

COPYGROUP picto ;
  CMR picto550 AUDIT;
COPYGROUP snap ;
  CMR snap1 AUDIT;

```

2

RENDER Subcommand (COPYGROUP)

RENDER Command (COPYGROUP)

```

RENDER [{IOCA | OBJC | PTOCA | GOCA}
{PERCEPTUAL | SATURATION | RELCM | ABSCM}]... [DEFAULT | MONOCH] ;

```

RENDER

Specify the Rendering Intent (RI) and device output appearance for the collection of pages/sheets presented by a **COPYGROUP**. The command is to be placed after the **COPYGROUP** command for which it is intended.

Parameters

object type parameter

Specify the object type to which the following rendering intent parameter applies. Object type and rendering intent parameter pairs may be repeated to define RI for all object types.

IOCA

The following rendering intent applies to all IOCA objects in the pages presented by the **COPYGROUP**.

OBJC

The following rendering intent applies to all non-OCA object in the pages presented by the **COPYGROUP**.

PTOCA

The following rendering intent applies to all PTOCA objects in the pages presented by the **COPYGROUP**.

GOCA

The following rendering intent applies to all GOCA objects in the pages presented by the **COPYGROUP**.

rendering intent parameter

Specify the rendering intent for the preceding object type.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

device output appearance parameter

Specify one of a set of architected appearances to be assumed by the presentation device.

DEFAULT

Default appearance. The device assumes its normal appearance. For example, the default appearance of a process-color printer would be to generate full color output.

MONOCH

Monochrome appearance. The device assumes a monochrome appearance such that the device's default color is used for presentation. The device can simulate color values with grayscale using the default color, or it can simulate color values by simply substituting the default color, or it can use some combination of the two.

Code Example

The following example shows two copy groups, one with IOCA RI defined and monochromatic appearance, and one with RI for all object types and the device default appearance.

Example

```
FORMDEF cmrXm4 REPLACE yes;
COPYGROUP cg1;
  RENDER IOCA percp MONOCH ;
COPYGROUP cg2;
  RENDER DEFAULT OBJC abscm IOCA relcm PTOCA satur
  GOCA percp;
```

CMR Subcommand (PAGEFORMAT)

CMR Command (PAGEFORMAT)

```
CMR cmr-lname {AUDIT | INSTR | LINK} ;
```

CMR

Associate a Color Management Resource (CMR) with pages presented by a **PAGEFORMAT**. The command is to follow the **PAGEFORMAT** command. Multiple **CMR** commands are allowed in a **PAGEFORMAT**.

Parameters

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

processing mode parameter:

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

Code Example

In the following example, two CMRs are defined/associated for all pages presented with pageformat "pf5":

1. The first CMR named "mycmr" is an audit CMR for a digital camera.
2. The second CMR named "dark1" is a generic instruction CMR.

Example

```

DEFINE mycmr CMRNAME
    'Pict1550CC001.001PictV550@@'
    'ES1@@@@@@@@@@@@@spac@@@@@@@@@@@@@RGB@'
    'XYZ@@@@@@@@@@@' ;

DEFINE dark1 CMRNAME
    '@@@@@@@@@@TCgeneric@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
    'dark@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@' ;

PAGEDEF cmrXm5 REPLACE yes;

PAGEFORMAT pf5;
    CMR mycmr          AUDIT;
    CMR dark1          INSTR;

    PRINTLINE;

PAGEFORMAT pfx;
    PRINTLINE;

```

RENDER Subcommand (in a PAGEFORMAT)

RENDER Command (PAGEFORMAT)

```

RENDER [{ IOCA | OBJC | PTOCA | GOCA } { PERCEPTUAL | SATURATION |
RELCM | ABSCM }]... ;

```

RENDER

Specify the page/overlay scope rendering intent (RI) for the pages formatted by this **PAGEFORMAT**. The **RENDER** command must follow the **PAGEFORMAT** command but precede the **PRINTLINE**, **LAYOUT**, or **XLAYOUT** commands.

RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC). For more information on RI see the current level of the ICC Specification.

Parameters

object type parameter

Specify the object type to which the following rendering intent parameters applies. Object type and rendering intent parameter pairs may be repeated to define RI for all object types.

IOCA

The following rendering intent applies to an IOCA objects in the page/overlay that are presented by the **PAGEFORMAT**.

OBJC

The following rendering intent applies to a non-OCA object containers in the page/overlay that are presented by the **PAGEFORMAT**.

PTOCA

The following rendering intent applies to a PTOCA objects in the page/overlay that are presented by the **PAGEFORMAT**.

GOCA

The following rendering intent applies to a GOCA objects in the page/overlay that are presented by the **PAGEFORMAT**.

rendering intent parameter

Specify the rendering intent for the preceding object type.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

Code Example

In the following example, there are four different pages (**PAGEFORMATs**) with **RENDER** commands defined.

1. The first page **RENDER** command defines the RI for IOCA objects as perceptual.
2. The second page **RENDER** command defines the RI for non-OCA objects as saturation.
3. The third page **RENDER** command defines the RI for PTOCA objects as media-relative colorimetric.
4. The fourth page **RENDER** command defines the RI for all supported objects.

Example

```
PAGEDEF cmrXm6  REPLACE yes;

PAGEFORMAT pf6a;
  RENDER IOCA  perceptual;
  PRINTLINE;
```

```

PAGEFORMAT pf6b;
  RENDER OBJC saturation;
  PRINTLINE;

PAGEFORMAT pf6c;
  RENDER PTOCA relcm;
  PRINTLINE;

PAGEFORMAT pf6d;
  RENDER OBJC abscm IOCA relcm PTOCA satur GOCA percp;
  PRINTLINE;

```

2

OBJECT Command

```

OBJECT
:
OBTYPE {PSEG | IOCA | BCOCA | GOCA | OTHER OBID
[component-id | type-name]}
:
RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}
:
{OB2CMR cmr-1name {AUDIT | INSTR| LINK} [NOPRELOAD | PRELOAD]}... ;
:

```

OBJECT

The full **OBJECT** command and all its other non-CMR subcommands are described in [OBJECT Command, p. 371](#).

Subcommand

OBTYPE

Specifies the object type.

PSEG

Specifies a page segment object, as described in the *Mixed Object Document Content Architecture (MODCA) Reference Manual*. All mapping types (**OBMAP**) are allowed by PPGA; however, the print server issues an error if any of the objects contained in the page segment is not compatible with the coded **OBMAP** parameter.

GOCA

Specifies a graphics object, as described in the *Graphics Object Content Architecture (GOCA) Reference Manual*. **GOCA** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBMAP** subcommand.

BCOCA

Specifies a bar code object, as described in the *Bar Code Object Content Architecture (BCOCA) Reference Manual*. **BCOCA** allows you to specify only the **LEFT** parameter on the **OBMAP** subcommand.

IOCA

Specifies a image object, as described in the *Image Object Content Architecture (IOCA) Reference Manual*. The **IOCA** object type allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBTMAP** subcommand.

OTHER

Specifies other object data. The object data to be included is a paginated presentation object with a format that may or may not be defined by an AFP presentation architecture. When you specify **OTHER**, you must also specify the **OBID** parameter. The **OTHER** object type allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBTMAP** subcommand.

OBID

Specifies either a component identifier or a type name from Table “Non-OCA Objects Supported by IOB” in [Subcommands](#), p. 372.

RENDER

Subcommand on the **OBJECT** command to specify the rendering intent (RI) for an object within a page definition.

RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC). For more information on RI see the current level of the ICC Specification.

Note

1. Rendering intent on a BCOCA object is fixed as media-relative colorimetric (**RELCM**), so **RENDER** doesn't have to be coded for a BCOCA object. But if you do specify something other than **RELCM**, PPFA will flag an error.
2. A page segment (**PSEG** object type) can contain many object types. If you specify **RENDER** for a **PSEG**, PPFA sets that rendering intent type for all object types in the page segment.

rendering intent parameter

Specify the rendering intent for the preceding object type.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

OB2CMR

Specify a Color Management Resource (CMR) and its process mode for a data object within the page definition. CMRs are secondary objects when used at this level. Multiple **OB2CMR** subcommands are allowed on the **OBJECT** command.

cmr-lane

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

processing mode parameter

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a CD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the **CMR** as a link CMR. This processing mode is only valid for device link (DL) CMRs. The PPFA command **RENDER** is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

NOPRELOAD or **PRELOAD**

All specified secondary resources are kept. If you wish the CMR object to be preloaded prior to the running of this job, specify it here.

Code Example

In the following example, an object with CMR is defined. The **LAYOUT** commands below place the object on the page. The CMR name is defined and referenced by the CMR local name. See the **DEFINE CMRNAME** command for examples and instructions on defining CMR names.

Example

```
PAGEDEF cmr89  replace yes;
  FONT  varb  gt10  ;           /*Variable data           */
  SETUNITS  LINESP .25 in ;     /* Line spacing           */

DEFINE srgb CMRNAME
'sRGBicc_CC001.000@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
'@@@@@@';

Object oc1  obxname 'Flowers_with_sRGB_profile'
  obtype  other  obid 23 OBKEEP
  ob2cmr  srgb  audit;

PAGEFORMAT rept1  TOPMARGIN 1 in BOTMARGIN 2 in;
  LAYOUT 'startpage' BODY  NEWPAGE POSITION 1 in NEXT
  font  varb
  object oc1 0 in 3 in  obsize 6.5 in 8.5 in;
  LAYOUT 'basicline' BODY  POSITION SAME NEXT font  varb;
```

FIELD command (All Page Definition Types)

Bar Code CMR subcommand

```
FIELD
:
BARCODE
:
{CMR cmr-lname {AUDIT | INSTR | LINK}}... ;
:
```

FIELD

The full **FIELD** command and all its other non-CMR subcommands are described in [FIELD Command, p. 312](#).

Subcommand

CMR

Specify a Color Management Resource (CMR) and its process mode for the bar code object being presented.

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

Note

This parameter must immediately follow the **CMR** keyword.

processing mode parameter

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs. The PPFA command RENDER is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

Code Example

In the following example, 2 bar codes are defined with CMRs specified. The bar codes are defined for traditional, record format and XML page definitions.

Note

The **DEFINE CMRNAMEs** for "mycmr" and **dark1** are used in each page definition but defined only once. Page definitions that are in the same source file can only define a local CMR name once. This is because a **DEFINE CMRNAME** definition is global for all page definitions and form definitions in the same source code file.

Example

```
DEFINE mycmr CMRNAME
```

```

        'Pict1550CC001.001PictV550@@'
        'CS@@@@@@@@@@@@@@@@@spac@@@@@@@@@@@@@@@@@RGB@'
        'XYZ@@@@@@@@@@@@@' ;
DEFINE dark1    CMRNAME
        '@@@@@@@@TCgeneric@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
        'dark@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@' ;

/* Traditional Pagedef          */
PAGEDEF cmr10P  REPLACE yes;
PRINTLINE;
    FIELD Start 1 Length 20
    BARCODE TYPE code39 MOD 1
    CMR myCMR  audit;
    FIELD Start 21 Length 40
    BARCODE TYPE code39 MOD 1
    CMR dark1  instr;

/* Record Layout Pagedef      */
PAGEDEF cmr10L  REPLACE yes;
Font f1;
LAYOUT 'L1';
    FIELD Start 1 Length 20
    BARCODE TYPE code39 MOD 1
    CMR myCMR  audit;
    FIELD Start 21 Length 40
    BARCODE TYPE code39 MOD 1
    CMR dark1  instr;

/* XML Pagedef                */
PAGEDEF cmr10X  REPLACE yes;
Font f1 TYPE ebcdic;
XLAYOUT QTAG 'x1';
    FIELD Start 1 Length 20
    BARCODE TYPE code39 MOD 1
    CMR myCMR  audit;
    FIELD Start 21 Length 40
    BARCODE TYPE code39 MOD 1
    CMR dark1  instr;

```

EXTREF Command

```

EXTREF
:
OB2CMR cmr-lname {AUDIT | INSTR | LINK}
:
OB2R {i2name | 'i2name' | C'i2name' | E'i2name' | A'i2name' | X'hhhh'}
OB2XNAME{x2name | 'x2name' | C'x2name' | E'x2name' | A'x2name' | X'hhhh' |
        U8'x2name' | U16'x2name' | X8'hhhh' | X16'hhhh'}
:
OB2ID {n | type-name }
:

```

The **EXTREF** command specifies resources that are to be mapped in the page. It is a way in PPFA to map objects that wouldn't otherwise be mapped. If an object contains another mapped object, the contained object must be mapped, but PPFA will not automatically map that object.

EXTREF

The full **EXTREF** command and all its other non-CMR subcommands are described in [EXTREF Command, p. 307](#).

Subcommands

OB2CMR subcommand

```
OB2CMR cmr-lname {AUDIT | INSTR | LINK}
```

OB2CMR

Specify a Color Management Resource (CMR) and its process mode for a data object specified within an included object. CMRs are secondary objects when used at this level. An object specified here will be mapped with "object" scope.

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

processing-mode-parameter

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs. The PPFA command RENDER is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

OB2R Subcommand

```
OB2R { i2name | 'i2name' | C'i2name' | E'i2name' | A'i2name' | X'hhhh' }
```

OB2R

Specify a secondary object to be mapped.

If an included object contains a reference to one or more secondary objects, you must identify them at this point. Specify the internal name for the secondary resource as specified in the included resource. If the internal name contains special characters such as periods or blanks, then quotes must surround the name.

i2name

Unquoted name up to 250 characters long will be folded to upper case and translated into EBCDIC if necessary.

'*i2name*'

Quoted name up to 250 characters long will be accepted as-is with no case folding or translation.

C'*i2name*'

Quoted name with a "C" for Character will be treated the same as a quoted name of up to 250 characters. No folding or translation will be done.

E'*i2name*'

Quoted name with an "E" for EBCDIC entered with up to 250 characters will be accepted as-is if on an EBCDIC platform or translated to EBCDIC if on an ASCII platform. The translation will be made with no case folding.

A'*i2name*'

Quoted name with an "A" for ASCII entered with up to 250 single-byte characters will be accepted as-is if on an ASCII platform or translated to ASCII if on an EBCDIC platform. The translation will be made with no case folding.

X'*hhhh*'

Quoted name with an "X" for Hexadecimal entered with up to 500 hexadecimal characters. The characters will be translated to hexadecimal, but no assumptions of data type will be made.

OB2XNAME Subcommand

```
OB2XNAME { x2name | 'x2name' | C'x2name' | E'x2name' | A'x2name' | X'hhhh' |  
U8'x2name' | U16'x2name' | X8'hhhh' | X16'hhhh' }
```

OB2XNAME

Specifies the external name for a secondary resource object. The name can be up to 250 characters. If the name contains special characters or blanks, then quotes must surround the name.

x2name

Unquoted name up to 250 characters long will be folded to upper case and translated into EBCDIC if necessary.

'*i2name*'

Quoted name up to 250 characters long will be accepted as-is with no case folding or translation.

C'*x2name'*

Quoted name with an "C" for Character will be treated the same as a quoted name up to 250 characters. No folding or translation is done.

E'*x2name'*

Quoted name with an "E" for EBCDIC entered with up to 250 single-byte characters will be accepted as-is if on an EBCDIC platform or translated to EBCDIC if on an ASCII platform. The translation will be made with no case folding.

A'*x2name'*

Quoted name with an "A" for ASCII entered with up to 250 single-byte characters will be accepted as-is on an ASCII platform or translated to ASCII if on an EBCDIC platform. The translation will be made with no case folding.

X'*hhhh'*

Quoted name with an "X" for Hexadecimal entered with up to 500 hexadecimal characters. The characters will be translated to hexadecimal, but no assumption of data type will be made.

U8'*x2name'*

Quoted name with a "U8" for UTF-8 entered with up to 250 single-byte characters will be translated to UTF-8.

X8'*hhhh'*

Quoted name with an "X8" for UTF-8 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-8. There must be a multiple of 2 hexadecimal characters entered.

U16'*x2name'*

Quoted name with a "U16" for UTF-16 entered with up to 125 single-byte characters will be translated to UTF-16.

X16'*hhhh'*

Quoted name with an "X16" for UTF-16 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-16. There must be a multiple of 4 hexadecimal characters entered.

OB2ID Subcommand

```
OB2ID {n | type-name }
```

OB2ID

Specifies the component type identifier for a secondary resource.

n

Object type number from the "Component ID" column of Table [Object Types that can be referenced as Secondary Resources](#), p. 198.

Object Types that can be referenced as Secondary Resources

Type Name	Component ID	Description of OID Type-Name
PDFRO	26	PDF Resource Object (new)
RESCLRPRO	46	Resident Color Profile Resource Object
IOCAFS45RO	47	IOCA FS45 Resource Object Tile (new)

type-name

Type name from the "Type name" column of Table [Object Types that can be referenced as Secondary Resources](#), p. 198.

Code Example

In the example below, the CMR "rtvc" is mapped in the Object Environment Group (OEG) of an object that is being included in the page.

Note

If we code "rtvc" with a CMR command (as in the commented out CMR command) it will be mapped but will be active for the entire page and we only want it to be active for the object in whose OEG it is mapped.

Example:

```

DEFINE rvtc CMRNAME
'RevVideoTC001.000@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
  '@@@@@@' DNXC MR;

SETUNITS LINESP .25 in ;      /* Line spacing      */

PAGEFORMAT rept1 TOPMARGIN .25 in;
EXTREF OB2CMR rvtc instr;

```

DRAWGRAPHIC Command (Record Format and XML)

PAGEDEF: CMR and RENDER Subcommands on DRAWGRAPHIC command

```

DRAWGRAPHIC {BOX | LINE | CIRCLE | ELLIPSE}
:
[RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}]
[CMR cmr-lname {AUDIT | INSTR | LINK}]... ;

```

DRAWGRAPHIC

The full **DRAWGRAPHIC** command and all its other non-CMR subcommands are described in:

- [DRAWGRAPHIC BOX Command \(Record Format and XML\)](#), p. 287
- [DRAWGRAPHIC LINE Command \(Record Format and XML\)](#), p. 293
- [DRAWGRAPHIC CIRCLE Command \(Record Format and XML\)](#), p. 296
- [DRAWGRAPHIC ELLIPSE Command \(Record Format and XML\)](#), p. 301

Subcommands

RENDER

Subcommand on the **DRAWGRAPHIC** command to specify the rendering intent (RI) for the graphics object being presented.

RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC). For more information on RI see the current level of the ICC Specification.

rendering intent parameter

Specify the rendering intent for the defined graphic (GOCA) object.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

CMR

Specify a Color Management Resource (CMR) and its process mode for a graphics object within the page definition.

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

 **Note**

This parameter must immediately follow the CMR keyword.

processing mode parameter

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs. The PPFA command RENDER is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

Code Example

The following examples show how to define CMRs and rendering intent for graphics objects. Rendering intent and a CMR are defined for Record Format and XML page definitions which are the only two page definitions types for which **DRAWGRAPHIC** commands are legal.

```
DEFINE mycmr CMRNAME
    'Pict1550CC001.001PictV550@@'
    'CS@@@@@@@@@@@@@spac@@@@@@@@@@@@@RGB@'
    'XYZ@@@@@@@@@@@' ;

PAGEDEF cmr11L REPLACE yes;
    FONT f1;
    LAYOUT 'L1';
    DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
    RENDER relcm CMR myCMR audit;

PAGEDEF cmr11X REPLACE yes;
    FONT f1 TYPE ebcdic;
    XLAYOUT QTAG 'x1';
    DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
```

```
RENDER relcm CMR myCMR audit;
```

3. PPFA Commands and Syntax

- **PPFA Command Syntax**
- **Form Definition Command Reference**
- **Page Definition Command Reference**

PPFA Command Syntax

PPFA controls are made up of four elements: commands, subcommands, parameters, and literals.

- *Commands* are controls representing the major functions of PPFA and are separated from other commands by semicolons. Each command has its own entry in [Form Definition Command Reference, p. 208](#) and in [Page Definition Command Reference, p. 269](#).
- *Subcommands* fall within commands and specify the function of that command.
- *Parameters* specify the values for one subcommand.
- *Literals, p. 206* consist of fixed text included in a field definition or as constant data for comparison in a conditional processing definition.

3

Rules for Creating a PPFA Command Stream

When you create a PPFA command stream, follow these rules:

- Before processing the commands, PPFA converts lowercase characters into uppercase characters, except those in literals. Thus, it does not discriminate between uppercase and lowercase characters. For example, **OVERLAY abc** and **overlay ABC** produce the same results because both **overlay** and **abc** are converted to uppercase.
- User names for [form definitions, p. 11](#) and [page definitions, p. 12](#) must not be the same as PPFA command names and subcommand names. These are reserved words. For a list of the reserved words, see [PPFA Keywords, p. 471](#). For example, **REPEAT** or **CHANNEL** must not be form-definition names.
- The subcommands governed by a command can be entered in any order; however, the name of a font or form definition, for example, must come immediately after the object being named. Parameters defined in a subcommand must be entered immediately after the subcommand.
- Commands must end with a semicolon.
- A command or subcommand can start in any column and can continue on the next line without a continuation indicator.
- More than one form definition and page definition can be specified in a job stream.
- PPFA neither checks nor sets default values for items that depend on printer hardware.

Token Rules

Tokens are character strings, within a set of PPFA commands, that PPFA recognizes as units. Tokens include:

- Both local names and user-access names for fonts, form definitions, page definitions, overlays, and suppressions
- Commands

- Subcommands
- Parameters
- Literals
- Special characters

The only PPFA element that is not a token is a blank. A token cannot be split between two lines.

To create a token, you must separate a string from the previous token by either a special character or a blank. See the list of special characters in [Character Set, p. 204](#). Thus, A+B is the same as A + B, because + is a special character. But AB is not the same as A B. The blank in A B creates two tokens.

3

Character Set

The four types of characters are alphabetic, numeric, blank, and special. Characters of each type are as follows:

- The following are PPFA alphabetic characters:

```
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
# @ $
```

- The following are PPFA numeric characters:

```
0 1 2 3 4 5 6 7 8 9
```

- The blank character has a character code of X'20' in ASCII (which is the data stream used for creating the form definition or page definition)

↓ Note

In EBCDIC data, the blank character has a character code of X'40'.

- The following are PPFA special characters:

```
. ( +* ) - % ' = ; / &
```

- The following are EBCDIC shift-out and shift-in codes:

```
X'0E', the shift-out (SO) code
```

```
X'0F', the shift-in (SI) code
```

Other character codes are also allowed within comments and literals. See [Comments, p. 206](#) and [Literals, p. 206](#) for details of what can be included.

Command Delimiters

A command always ends with a semicolon. One command can extend over several lines and does not end until a semicolon appears.

Blanks and Blank Lines

Blanks and blank lines can occur anywhere and have no effect on the processing of PPFA. The semicolon (;) is the command delimiter.

Names

The maximum number of alphanumeric characters in a PPFA name varies. The following table, [Character Length for PPFA Names, p. 205](#), shows the number of characters allowed in the PPFA names.

Character Length for PPFA Names

Type of Name	Number of Characters Allowed
Form Definition	
COPYGROUP	1–8
DEFINE CMRNAME (local name)	1–16
DEFINE CMRNAME (user-access name)	73
FORMDEF	1–6
OVERLAY (local name)	1–16
OVERLAY (user-access name)	1–6
SUPPRESSION	1–8
Page Definition	
BARCODE	1–8
CONDITION	1–8
DEFINE COLOR	1–10
DEFINE CMRNAME (local name)	1–16
DEFINE CMRNAME (user-access name)	73
DEFINE QTAG (local name)	1–16
DEFINE QTAG (XML tag names)	1–125
DOFONT (local name)	1–16
DOFONT (user-access name)	1–125
FONT (local name)	1–16
FONT (user-access name)	1–6
OBJECT (local-name)	1–16
OBJECT (external name) (See note)	1–250
Secondary OBJECT (internal name) (See note)	1–250
Secondary OBJECT (external name) (See note)	1–250
OVERLAY	1–6
PAGEDEF	1–6
PAGEFORMAT	1–8

Type of Name	Number of Characters Allowed
SEGMENT	1–6

Note

This name is further restricted to 250 bytes. For data type UTF-16 this is a maximum of 125 characters or less if surrogate characters are required. Some platforms have a limit of 8 characters.

Comments

3

Programmer comments used to document PPFA command streams are allowed anywhere within the command stream. Comments must be enclosed with the delimiters `/*` and `*/`. A comment is allowed anywhere a blank is allowed and can continue for any number of lines.

Note

For VSE, however, a comment must not start at the beginning of the line. As the first two bytes of a record in PPFA running under VSE, `/*` is interpreted as the end of system input.

The following example shows the available variations in comment formats:

```
FIELD /* comment */ FONT GT10 /* comment,
multiline comment,
more comment */ START * + 10 LENGTH 5 ;
FIELD LENGTH 10 ; FIELD START * + 10 LENGTH 15 ;
```

Note

1. A comment must end with the closing delimiter `*/`.
2. Double-byte character codes in comments must be enclosed within SO (X'0E') and SI (X'0F') on EBCDIC platforms.

Literals

A literal is any string specified in single quotation marks. Literals can be used within a:

- **TEXT**, subcommand to create fixed text for a page definition
- **WHEN** subcommand to define constant text for comparison

Literals can contain any characters in any position, except those that have special syntactic meanings. Single quotation marks may be used within a literal only if they are entered in pairs (`'`). PPFA translates a pair of single quotation marks into one quotation mark. For example, `'JOAN''S'` yields JOAN'S.

A literal can continue for any number of lines. For example:

```
TEXT 'THIS IS ' 'A LITERAL' /* The four separated */
'THE TEXT SPANS' /* text elements will produce*/
'THREE LINES' ; /* one sequence of text */

TEXT X'0101' /* Hexadecimal literals */
X'ABAB' /* spanning three lines */
X'BBBB' ;
```

```
TEXT K'100,200'          /* kanji numbers          */
      K'321,400'        ;          /* specified sequentially */
```

Invalid:

```
TEXT 'THIS IS'
      K'100,200'        ;          /* Mixing single-byte and
                                double-byte characters in one
                                field is not allowed */
```

A double-byte literal must be enclosed within apostrophe shift-out (X'7DOE') and shift-in apostrophe (X'0F7D').

Numeric Values

Numeric variables are specified as decimal numbers; up to three decimal places can be specified.

Units of Measurement

Numbers used to specify dimensions in form definitions and page definitions can be in any of five units of measurement. They are specified in a command stream as follows:

IN

Inches.

MM

Millimeters.

CM

Centimeters.

POINTS

Points are a common measurement in printing used to measure character height, as in 20-point type. A point is approximately 1/72 inch.

PELS

Pels are equivalent to L-units. The number of pels per inch is a user-specified parameter. The default is 240 pels per inch.

Two additional measurement units can be used in the **SETUNITS** command; the measurement units are:

LPI

Lines per inch

CPI

Characters per inch

The parameters in PPFA that define a measurement can include any of the first five units of measurement shown in the previous list. For example:

```
POSITION 1 IN 1 IN ;
```

or

```
POSITION 1 MM 1 MM ;
```

However, PPFA converts all measurements to logical units (L-units) as the common measurement. (Normally, one inch equals 240 L-units, but this number can be changed by the user.) If a fraction exists, the first decimal point is truncated. A **SETUNITS** command defines a unit of measurement that is to be used as the default for any parameter that does not specify a given dimension. This default is in effect until another **SETUNITS** command is encountered. This example shows part of a PPFA command stream in which a **SETUNITS** command sets the units of measurement to one inch for a subsequent **POSITION** (or **OFFSET** or **LINEONE**) subcommand.:

```
SETUNITS 1 IN 1 IN ;
:
POSITION (or OFFSET or LINEONE) 1 1 ;
```

SETUNITS can be used as a multiplier:

```
SETUNITS 2 IN 2 IN ;
:
POSITION 2 2 ;
```

In this example, the **SETUNITS** command sets two-inch x and y default values. The **POSITION** subcommand values are multiplied by the default values creating a position four inches horizontally and four inches vertically from a given reference point. See [SETUNITS Command, p. 264](#) for a more detailed explanation.

Diagram Shorthand

These terms are used in the command definitions:

x-pos

A horizontal position using a numeric number followed optionally by a unit. For the available units, see [Units of Measurement, p. 207](#).

y-pos

A vertical position using a numeric number followed optionally by a unit. For the available units, see [Units of Measurement, p. 207](#).

Form Definition Command Reference

This section includes:

- Sequence of commands for form definitions
- Form definition commands listed alphabetically
- Detailed information on each command
- Descriptions of the applicable subcommands and parameters for each command

Sequence of Commands for Form Definitions

```
[SETUNITS, p. 264 ...]
FORMDEF, p. 235
[SUPPRESSION, p. 268 ...]
  [DEFINE CMRNAME, p. 174...]
  [CMR, p. 178...]
  [CMRTAGFIDELITY, p. 174...]
  [RENDER, p. 180...]
[COPYGROUP, p. 210 ]
  [CMR, p. 182 ...]
  [OVERLAY, p. 263 ...]
  [RENDER, p. 184 ...]
  [SUBGROUP, p. 265 ...]
```

1. **SUPPRESSION** commands must be specified immediately after **FORMDEF** commands. The exception is the **SETUNITS** command.
2. One file can contain multiple sets of form definitions.
3. **OVERLAY** and **SUBGROUP** commands must be specified under their associated **COPYGROUP** command. The **OVERLAY** commands must be specified immediately after a **COPYGROUP** command.
 - The **OVERLAY** command is required only to designate an overlay that is to be kept in the 3800 printer as raster data, or to specify a local name for referencing an overlay in a **SUBGROUP** command. If you do not code the **OVERLAY** command, you can still specify an overlay in a **SUBGROUP** command using its user-access name.
 - Overlays also may be specified using the **N_UP** subcommand of the **FORMDEF** or **COPYGROUP** command, or using the **PRINTLINE** command in the page definition. If the overlay is specified in one of these ways, it should also not be coded on the **OVERLAY** or **SUBGROUP** commands shown here. For more information, see [Medium Overlays and Page Overlays, p. 162](#).

↓ Note

- 1) If the form definition has only one copy group, the **COPYGROUP** command can be omitted. The **OVERLAY** command then follows any **SUPPRESSION** command.
- 2) The appearance of a misplaced **OVERLAY** command prior to the first **COPYGROUP** command causes a default **COPYGROUP** to be generated as the first **COPYGROUP**.
4. The first **COPYGROUP** command can be omitted in a form definition if it contains only one copy group and no **OVERLAY** commands. If it is omitted, the **FORMDEF** command parameters are used to define the copy group.
5. A **SETUNITS** command can be placed before any PPGA command. The values set are in effect until the next **SETUNITS** command.
6. Each command can appear more than once under one **FORMDEF** command.
7. To do an **INSERT** finishing task, select a **COPYGROUP** that specifies the dedicated **INSERT** bin number from which the pages are to be inserted and apply (usually dummy) print data to that page. Observe that nothing is printed on the inserted page.

↓ Note

The **INSERT** bin number is printer specific. See the documentation for the specific printer being used.

COPYGROUP Command

COPYGROUP Command

```
COPYGROUP name
[OFFSET rel-x rel-y [rel-x rel-y]]
[[BIN 1] | [BIN {n | MANUAL | ENVELOPE}]
  [MEDIANAME qstring] [COMPID m]]]
[OUTBIN n]
[CONSTANT {NO | BACK | FRONT | BOTH}]
[DIRECTION {ACROSS | DOWN | REVERSE}]
[PRESENT {PORTRAIT | LANDSCAPE}]
[DUPLEX {NO | NORMAL | TUMBLE | RNORMAL | RTUMBLE}]
[CUTSHEET {NO|YES}]
[FINISH [[SCOPE SHEET OPERATION AFP ZFOLD REFERENCE DEFAULT] |
  [SCOPE {SHEET | BEGCOLL | CONTCOLL} OPERATION
  Operation Parameters]... ]]
[ADJUST n]
[INVOKE {SHEET | NEXT | FRONT | BACK}]
[JOG {YES | NO}]
[QUALITY n]
[PROCESSING [MEDIA_INFO {n... | PERFORATE| CUT}]...]
[N_UP {1 | 2 | 3 | 4} [OVERLAY Subcommand... | PLACE Subcommand...]]
[PELSPERINCH n]
Form-size Parameters ;
```

OPERATION Parameters

```
[[AFP] { ZFOLD | CFOLDIN | CORNER | CUT | EDGE | FOLD |
PERFECTBIND | PERFORATE | PUNCH | RINGBIND | SADDLE[OUT] | SADDLEIN}]...
More OPERATION parameters
UP3I {XType {n | X'hh'} [XOper {X'FFFF | n | X'hhhh'}]}...
More OPERATION parameters
```

More OPERATION Parameters

```
[REFERENCE {DEFAULT | TOP | BOTTOM | LEFT | RIGHT | TOPLEFT |
TOPRIGHT | BOTLEFT | BOTRIGHT}]
[OPCOUNT n | OPPOS n...][OPOFFSET n]
```

OVERLAY Subcommand

```
OVERLAY name][rel-x rel-y][PARTITION]
[OVROTATE {0 | 90 | 180 | 270}] [PFO ]
```

PLACE Subcommand

```
PLACE n [FRONT | BACK] [CONSTANT]
[OFFSET rel-x rel-y]
Overlay Subcommand
[ROTATION {0 | 90 | 180 | 270}]
[VIEW {YES | NO}]
```

↓ Note

The use of the **PLACE** subcommand indicates enhanced N_UP printing.

Form-size Parameters

```
[XMSIZE x [units]]
[YMSIZE y [units]]
```

Copy groups are subsets of a form definition. A form definition can contain one or several copy groups. Copy groups are nested within a form definition following any **SUPPRESSION** command. **COPYGROUP** subcommands have no fixed defaults; if any subcommand is omitted, its value is selected from the corresponding subcommand in the **FORMDEF** command.

COPYGROUP *name*

Defines an alphanumeric name of 1–8 characters. This name must be unique in a single form definition. If any names are duplicated, PPFA issues an error message and does not create the form definition.

↓ Note

1. Subsets of copy groups are called subgroups.
2. If you specified **DUPLEX NO** anywhere in the copy group, output is simplex regardless of any other **DUPLEX** subcommand within the same copy group.
3. If a form definition has only one copy group, the **COPYGROUP** command can be omitted. If omitted, a name is automatically assigned by PPFA to the copy group, using the form definition resource name, including the F1 prefix. All values for the copy group are given the values from the **FORMDEF** command and subcommands. You need to know this name should you use conditional processing and need to invoke this copy group by name. Copy groups are placed within the form definition in the order in which they are generated.
4. To change copy groups during formatting, use conditional processing.
5. Another way to change copy groups after the resource is stored is to insert an Invoke Medium Map structured field into your print data file (copy groups are known to the print server as medium maps). If no Invoke Medium Map structured field is found and no conditional processing is being performed, the first copy group in the form definition is used for the job.

Subcommands

OFFSET Subcommand

```
OFFSET rel-x rel-y [rel-x rel-y]
```

Specifies the relative offset of the logical page for both the front and back pages in reference to the media origin. The media origin is printer dependent. For more information about media origin, see your printer publications.

If you specify offset values for the back of the page, you must also specify the front offset values.

↓ Note

The **OFFSET** subcommand does not affect the position of medium overlays.

rel-x

Specifies the relative horizontal offset of the logical page on the front or back side of the copy group relative to the media origin. The valid options for *rel-x* are described in the **SETUNITS** command for the horizontal value.

If no unit is specified, a default setting is:

- Taken from the last **SETUNITS**, p. 264 command
- **IN** (inch) if no **SETUNITS** command has been issued

rel-y

Specifies the relative vertical offset for the logical page for the front or back side of the page. The valid options for *rel-y* are described in the **SETUNITS** command for the vertical value.

Note

The vertical offset for the 3800 must be 0.5 inch or greater.

If no unit is specified, a default setting is:

- Taken from the last **SETUNITS**, p. 264 command
- **IN** (inch) if no **SETUNITS** command has been issued

Note

1. If **OFFSET** is *not* specified, the **OFFSET** default is **0.1 IN 0.1 IN**
2. You may specify this offset as negative in order to crop the top and/or left of an image.

BIN Subcommand

```
[BIN 1] | [BIN {n | MANUAL | ENVELOPE}]
[MEDIANAME qstring] [COMPID m]
```

Specifies the paper source. This subcommand should be used only for printers that have more than one paper source.

1

Selects the primary paper source.

n

Selects a paper source identified by an integer from 2–255. If the specified bin does not exist on your printer, the default paper source for that printer is used. For more information about paper sources on your printer, refer to your printer publications.

MANUAL

Selects manual feed as a paper source on those printers that support manual feed. For more information, refer to your printer publications.

ENVELOPE

Selects an envelope paper source on those printers that support this function. For more information, refer to your printer publications.

MEDIANAME

Selects a media source by specifying an agreed-upon name for the bin.

qstring

Up to 12 characters within single quotes, specifying the media source name. On some printers, this name is pre-set into the printer; on other printers, it can also be

entered into the printer by the user. For a current list of the valid media names, see [PPFA Media Names, p. 476](#). Refer to your printer publications for further information.

COMPID

Selects a bin based on the component ID.

m

For a current list of component ids, see [PPFA Media Names, p. 476](#). Component ids from 12,288 to 268,435,455 are reserved for the user.

Note

1. BIN selection is overridden by the printer if the form defined to each bin is the same form number. Only the primary bin is selected.
2. The primary source usually contains either letter-size (U.S.) or A4 (I.S.O.) paper. Other paper sources are used for less common paper sizes (such as legal-size) and for special paper (such as colored stock or pre-printed letterhead on heavy bond).
3. If duplexing is requested and you select from the front side from one bin and the back side from another bin, a warning message is issued and the printer takes the paper from the bin specified on the front side.

3

OUTBIN Subcommand

OUTBIN*n*

Specifies the destination bin number for any pages directed by this **COPYGROUP**. Subgroups in this form definition that do not specify an output bin number inherit this one.

n

Specifies the output bin number.

CONSTANT Subcommand

CONSTANT {**NO** | **BACK** | **FRONT** | **BOTH**}

Specifies whether the constant-forms function is on or off and whether constant form is to be printed on the front or back sides of a sheet.

NO

Specifies that the constant forms function is off.

BACK

Specifies that a constant form is to be printed on the back side without variable data.

FRONT

Specifies that a constant form is to be printed on the front side without variable data.

BOTH

Specifies that a constant form is to be printed on both sides without variable data.

DIRECTION Subcommand

DIRECTION {**ACROSS** | **DOWN** | **REVERSE**}

Determines, along with the **PRESENT** subcommand, how data is oriented on printers whose media origin can be changed. See the list of printers [N_UP Printing, p. 143](#).

If you are printing line data, you usually specify the same value for the **DIRECTION** subcommand as is specified for the **DIRECTION** subcommand in the page definition.

ACROSS

Specifies that the pages are formatted in the **ACROSS** printing direction.

DOWN

Specifies that the pages are formatted in the **DOWN** printing direction.

REVERSE

Specifies that the pages are formatted in the **REVERSE** printing direction.

If the **DIRECTION** subcommand is specified, you must specify the **PRESENT** subcommand. The default for **DIRECTION** is determined by the value specified for **PRESENT**.

The direction default of **PORTRAIT** is **ACROSS**; the direction default of **LANDSCAPE** is **DOWN**. If neither **PRESENT** nor **DIRECTION** is specified, the default is **PRESENT PORTRAIT** and **DIRECTION ACROSS**.

PRESENT Subcommand

```
PRESENT {PORTRAIT | LANDSCAPE}
```

Specifies, along with the **DIRECTION** subcommand, how the data is oriented on printers whose media origin can be changed.

The **PRESENT** and **DIRECTION** subcommands are only supported by cut-sheet printers when you specify the **N_UP** subcommand or the **CUTSHEET** subcommand with the **YES** parameter. See [Figure N_UP 1 Partition Numbering, Front Sheet-Side, p. 145](#) through [Figure N_UP 4 Partition Numbering, Front Sheet-Side, p. 146](#) to determine the effect of the **PRESENT** and **DIRECTION** subcommands when you use them with the **N_UP** subcommand.

PORTRAIT

Specifies that the pages are printed in the portrait page presentation, with their short edges at the top and bottom and their long edges at the sides.

LANDSCAPE

Specifies that the pages are printed in the landscape page presentation, with their long edges at the top and bottom and their short edges at the sides.

DUPLEX Subcommand

```
DUPLEX {NO | NORMAL | TUMBLE | RNORMAL | RTUMBLE}
```

Specifies whether printing is done on both sides of the sheet. This subcommand should be used only for page printers that have duplex capability.

NO

Duplex printing is not performed.

NORMAL

Duplex printing is performed, with the tops of both sides printed along the same edge for side binding.

TUMBLE

Duplex printing is performed with the top of one side and the bottom of the other printed along the same edge of the sheet for top binding.

RNORMAL

Rotated normal. Duplex printing is performed with the tops of both sides printed along the same edge. Used with landscape pages, **N_UP 2**, and **N_UP 3**.

RTUMBLE

Rotated tumble. Duplex printing is performed with the top of one side printed along the same edge of the sheet as the bottom of the other. Used with landscape pages, **N_UP 2**, and **N_UP 3**.

CUTSHEET Subcommand

```
CUTSHEET {NO|YES}
```

If you are using a cut-sheet printer, this subcommand specifies whether the medium orientation information, using the **DIRECTION** and / or **PRESENT** subcommands, is to be passed to the printer. The default value is **NO**.

YES

Specifies the rotation data is to be passed.

NO

Specifies the rotation data is not to be passed unless **N_UP** is coded.

 **Note**

1. If you have a continuous form printer, the medium orientation information is passed. If you have a cut-sheet printer and **N_UP** is coded, the orientation information is passed.
2. If you have a cut-sheet printer and **CUTSHEET YES** is coded, the orientation information is passed, providing you also have a level of the print server that supports that feature.
3. You must have a printer that allows its media origin to be changed in order to use this subcommand.

Example:

In the following example, the **CUTSHEET** subcommand is coded on the form definition to give copygroups c1 and c2 **CUTSHEET YES** behavior and copygroup c3 **CUTSHEET NO** behavior. The copygroup c1 inherits its behavior from the form definition.

```
FORMDEF cut1 REPLACE YES CUTSHEET YES;
COPYGROUP c1 ;
COPYGROUP c2 CUTSHEET YES ;
COPYGROUP c3 CUTSHEET NO ;
```

FINISH Subcommand

```
FINISH [[SCOPE SHEET OPERATION AFP ZFOLD REFERENCE DEFAULT] |
[SCOPE {SHEET | BEGCOLL | CONTCOLL} OPERATION
Operation Parameters]... ]
```

A finishing operation is to be performed on this **COPYGROUP**. This option is to be used only on a document, set of documents, or an entire print file.

SCOPE

Determines to which sheets the finishing operation is applied.

↓ Note

SCOPE can be repeated within a **FINISH** subcommand, but only one **SCOPE** of a particular type is allowed in each **COPYGROUP** command. For example, only one **SCOPE BEGCOLL** is allowed in a **COPYGROUP** command.

Single Sheet Scope

Operations with this **SCOPE** are applied to a single sheet.

SHEET

Single sheet Medium-map level scope. The specified finishing operation is applied to each sheet individually.

Collection Scope

Collection/Medium-map level scope. All sheets generated by this medium map are collected and the specified finishing operations are applied to this collection.

↓ Note

Some finishing operation combinations are not compatible. Compatible combinations are dependent upon the presentation-device.

BEGCOLL

Begin medium-map level collections. This causes a sheet eject and starts a medium-map-level media collection for the specified operation. If a collection for the same finishing operation is already in progress from a previous medium map, that collection is ended and its specified finishing operation is applied. The media collection started with **BEGCOLL** continues until:

1. The end of the document is reached.
2. A medium map is invoked that is not **CONTINUE COLLECTION** for this same operation command.

When a finishing collection is ended for any of the above reasons, the specified finishing operation is applied.

CONTROLL

Continue medium-map level collection. This continues a medium-level media collection that was started for the same finishing operation by a previous medium map. The media collection started with **CONTROLL** continues until:

1. The end of the document is reached.
2. A medium map is invoked that is not **CONTINUE COLLECTION** for this same operation command.

When a finishing collection is ended for any of the above reasons, the specified finishing operation is applied.

OPERATION Parameters

[[AFP] { ZFOLD | CFOLDIN | CORNER | CUT | EDGE | FOLD |

```
PERFECTBIND | PERFORATE | PUNCH | RINGBIND | SADDLE[OUT] | SADDLEIN}}...
More OPERATION parameters
UP3I {XType {n | X'hh'}} {XOper {X'FFFF' | n | X'hhhh'}}}...
More OPERATION parameters
```

Specifies the type of **FINISH** operation and parameters.

Note

1. Compatible operations can be repeated with a specified **SCOPE**.
2. Your print server may have a limit on the number of collection operations allowed at one time.
3. The default for **OPERATION** is **ZFOLD**. It is necessary to code **OPERATION** only if **REFERENCE** is coded.

AFP

Specifies that these are Advanced Function Presentation (AFP) operations as defined in the *Mixed Object Document Content Architecture Reference*, SC31-6802 and the *Intelligent Printer Data Stream Reference*, S544-3417.

SHEET Operations

These operations operate on a single sheet of paper and are valid for **SCOPE SHEET**.

Note

The **PAGE** scope is obsolete. The **SHEET** subcommand should be used instead of **PAGE** subcommand. For compatibility purposes, the **PAGE** command is accepted as an alias for **SHEET**.

CFOLDIN

Center Fold In. Specifies that the media is folded inward along the center line that is parallel to the finishing operation axis. After this operation, the back side of the last sheet of the collection is outside. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation. **CFOLDIN** is applied to collected media, not to individual media.

Note

The datastream pages must already be properly ordered for the **CFOLDIN** operation.

CUT

Specifies that a separation cut is applied to the media along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation.

FOLD

Specifies that the media is folded along the axis of the finishing operation. The folding is performed along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation. This operation is applied to collected media, not to individual media.

PERFORATE

Specifies that a perforation cut is applied to the media along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation.

PUNCH

Specifies that one or more holes are to be punched or drilled into the media along the finishing axis. **PUNCH** is applied to the collected media, not to individual media.

ZFOLD

Perform a **ZFOLD** operation along the finishing edge (axis). Z-Folding causes the sheet to first be folded in half inwards (the front side of the sheet is now inside the fold) along a line parallel to the reference edge. The half of the sheet originally furthest from the reference edge is again folded in half outwards along a line parallel to the reference edge. For example, when Z-Folding is applied to an 11 by 17 inch sheet with the reference edge along a short side, the result is an 8.5 by 11 inch fold-out. The **OPOFFSET**, **OPCOUNT**, and **OPPOS** parameters are ignored for this operation. This operation is applied to an individual sheet.

↓ Note

REFERENCE is the only parameter allowed for **ZFOLD** and the only reference edges allowed are **DEFAULT**, **TOP**, **BOTTOM**, **LEFT**, and **RIGHT**.

AFP Collection Operations

These operations operate on a collection of sheets and are valid with **BEGCOLL** and **CONTCOLL**.

CFOLDIN

Center Fold In. Specifies that the media is folded inward along the center line that is parallel to the finishing operation axis. After this operation, the back side of the last sheet of the collection is outside. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation. **CFOLDIN** is applied to collected media, not to individual media.

↓ Note

The datastream pages must already be properly ordered for the **CFOLDIN** operation.

CORNER

Specifies that one staple is driven into the media at the reference corner (see **REFERENCE** parameter). For corner staples, the offset and angle of the staple from the selected corner is device dependent. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation. This operation is applied to collected media, not to individual media.

CUT

Specifies that a separation cut is applied to the media along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation.

EDGE

Specifies that one or more staples are driven into the media along the axis of the finishing operation. This operation is applied to collected media, not to individual media.

FOLD

Specifies that the media is folded along the axis of the finishing operation. The folding is performed along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation. This operation is applied to collected media, not to individual media.

PERFECTBIND

This operation specifies a type of book binding that glues the sheets of the group together at the reference edge (spine). When you specify **PERFECTBIND**, the **OPOFFSET**, **OPCOUNT**, and **OPPOS** parameters are ignored.

PERFORATE

Specifies that a perforation cut is applied to the media along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation.

PUNCH

Specifies that one or more holes are to be punched or drilled into the media along the finishing axis. **PUNCH** is applied to the collected media, not to individual media.

RINGBIND

This operation specifies a type of book binding when the sheets of the group are loosely connected at the reference edge (spine) by first drilling or punching a set of holes along the reference edge and then inserting a wire pattern through the holes. When you specify **RINGBIND**, the **OPOFFSET**, **OPCOUNT**, and **OPPOS** parameters are ignored.

SADDLE or SADDLEOUT

Specifies that one or more staples are driven into the media along the axis of the finishing operation, which is positioned at the center of the media, parallel to the reference edge (see **REFERENCE** parameter). The **OPOFFSET** parameter is ignored for this operation. This operation also includes a fold of the media outward along the finishing operation axis so that the front side of the first sheet in the collection is on the outside of the media collection. This operation is applied to collected media, not to individual media.

SADDLEIN

Specifies that one or more staples are driven into the media along the axis of the finishing operation, which is positioned at the center of the media, parallel to the reference edge (see **REFERENCE** parameter). The **OPOFFSET** parameter is ignored for this operation. This operation also includes a fold of the media inward along the finishing operation axis so that the front side of the first sheet in the collection is on the inside of the media collection. This operation is applied to collected media, not to individual media.

Note

The datastream pages must already be properly ordered for the **SADDLEIN** operation.

UP3i

Specifies that these operations will be passed to the printer using the Universal Printer Pre- and Post-Processing Interface (UP3i) finishing interface as specified in the "Form Finishing Operation Triplet" in the UP3i specification document. UP3i is an open standard intelligent interface intended for printers, pre-processors, post-processors, and other related applications.

Note

1. To use this function you must have printer server support as well as an attached UP3i device for the specified operation.
2. The complete UP3i specification document which includes the "Form Finishing Operation Triplet" is available at <https://www.afpconsortium.org/uploads/1/1/8/4/118458708/up3i-v1.20-3rd-party-specification.pdf>.

XType

Specifies the explicit value for the "Finishing Operation Type" in the UP3i Form Finishing Operation Triplet. Specify in hexadecimal or a decimal equivalent number the Finishing Operation Type. A value of 0 specifies a No Operation/Pass through paper operation. When 0 is coded in this field, the **XOper** field is ignored. Enter 2 hexadecimal digits or a decimal number less than or equal to 255.

XOper

Specifies the explicit value for the "Finishing Operation" or the "Finishing Operation Parameter" in the UP3i Form Finishing Operation Triplet. Specify in hexadecimal or a decimal equivalent number the Finishing Operation Type. A value of X'FFFF' specifies the device default operation for the specified finishing operation for the specified Finishing Operation Type in the **XType** parameter. Enter 4 hexadecimal digits or a decimal number less than or equal to 65535.

Note

1. PPFA does *not* check that the **XType**, **XOper**, or operation parameters are contextually correct. This allows new UP3i operations and parameters to be coded without having to install a new PPFA module. However, it also allows contextually incorrect operation and parameter values to be entered.
2. See Table [XType and XOper values, p. 222](#) for values of **XType** and **XOper**.

More OPERATION Parameters

```
[REFERENCE {DEFAULT | TOP | BOTTOM | LEFT | RIGHT | TOPLEFT |
TOPRIGHT | BOTLEFT | BOTRIGHT}]
[OPCOUNT n | OPPOS n...][OPOFFSET n
```

These operation parameters apply to both **AFP** and **UP3i** Operations with the noted exceptions.

REFERENCE

Selects the reference edge or corner for the finishing operation. The **REFERENCE** subcommand is optional and, when omitted, the **DEFAULT** attribute is the default.

DEFAULT

Specifies that the device default edge determines the reference edge.

TOP

Specifies that the reference is positioned along the top edge.

BOTTOM

Specifies that the reference edge is positioned along the bottom edge.

LEFT

Specifies that the reference edge is positioned along the left edge.

RIGHT

Specifies that the reference edge is positioned along the right edge.

TOPLEFT

Specifies that the reference corner is positioned at the top in the left corner. This **REFERENCE** parameter can be used only for **CORNER** operations.

TOPRIGHT

Specifies that the reference corner is positioned at the top in the right corner. This **REFERENCE** parameter can be used only for **CORNER** operations.

BOTLEFT

Specifies that the reference corner is positioned at the bottom in the left corner. This **REFERENCE** parameter can be used only for **CORNER** operations.

BOTRIGHT

Specifies that the reference corner is positioned at the bottom in the right corner. This **REFERENCE** parameter can be used only for **CORNER** operations.

OPCOUNT *n*

Use **OPCOUNT** to request a specific number of finishing operations; valid values are 1-122. Do not specify **OPPOS** values with **OPCOUNT**. If **OPPOS** is specified for corner staple, separation cut, perforation cut, or fold, this **OPCOUNT** value is ignored. The printer determines the positions of the operations. The default is **0** (zero).

OPPOS *n*

Use **OPPOS** to specify the offset of finishing operations along the finishing operations axis measured from the point where the finishing operation axis intersects the bottom edge or left edge of the medium toward the center of the medium. Each consecutive **OPPOS** parameter is used to position a single finishing operation centered on the specified point on the finishing operation axis.

For **AFP** the sub-parameter is an integer value in the range of 0-32,767 specified in millimeters.

For **UP3i** the sub-parameter is an integer value in the range of 0 to 999999999 specified in millipoints (1/72000 inch).

Do not specify the unit of measure. Do not specify **OPCOUNT** when you use **OPPOS**. If **OPPOS** is specified for corner staple, fold, separation cut, or perforation cut, the **OPCOUNT** value is ignored.

OPOFFSET *n*

Specifies the offset of finishing operation axis from the reference edge measured from the reference edge toward the center of the medium.

For **AFP** the sub-parameter is an integer value in the range of 0-32,767 specified in millimeters.

For **UP3i** the sub-parameter is an integer value in the range of 0 to 999999999 specified in millipoints (1/72000 inch).

Do not specify **OPOFFSET** for corner staple or saddle stitch; the corner staple or saddle stitch values are ignored when specified with **OPOFFSET**.

Table [XType and XOper values, p. 222](#) shows how to specify finishing operations.

XType and XOper values

XType Finishing Operation	XType Value	XOper Finishing Operation Parameter	XOper Value
No Operation / Pass through paper	X'00'	Not applicable	
Paper Input / Page Interpose	X'01'	Interpose from bin xx Stock Number	X'0001'—X'00FE'

XType Finishing Operation	XType Value	XOper Finishing Operation Parameter	XOper Value
(not used for AFP/IPDS)		Default Bin/Stock	X'FFFF'
Fold	X'03'	Folding parameters from fold catalog	X'100D'
		No Fold	X'0000'
		Default	X'FFFF'
Staple / Stitch	X'04'	Corner Staple	X'0001'
		Saddle Stitch In	X'0002'
		Saddle Stitch Out	X'0003'
		Edge Stitch	X'0004'
		Default	X'FFFF'
Cut	X'05'	Separation Cut	X'0001'
		Perforation Cut	X'0002'
		Cross Cut	X'0003'
		Default	X'FFFF'
Trim	X'06'	Front Edge	X'0001'
		1 Edge	X'0002'
		3 Edge	X'0003'
		5 Edge	X'0004'
		Default	X'FFFF'
Offset / Group Separator / Job Separator	X'07'	Offset to Left	X'0001'
		Offset to Right	X'0002'
		Device Default	X'FFFF'
Stack	X'08'	Alternate Offset Stack	X'0001'
		Device Default	X'FFFF'
Rotate	X'09'	90° Clockwise	X'0001'
		180° Clockwise	X'0002'
		270° Clockwise	X'0003'
		Device Default	X'FFFF'
Punch	X'0A'	Round Hole	X'0001'
		Rectangular Hole	X'0002'

XType Finishing Operation	XType Value	XOper Finishing Operation Parameter	XOper Value
		Device Default	X'FFFF'
Bind	X'0B'	Device Default	X'FFFF'
Merge	X'0C'	Handle Most Left Page First	X'0001'
		Handle Most Right Page First	X'0002'
		Device Default	X'FFFF'
Banding	X'0D'	Single Band Wrap	X'0001'
		Double Band Wrap	X'0002'
		Crossing Band Wrap	X'0003'
		Device Default	X'FFFF'
Shrink Wrap	X'0E'	Shrink Wrap	X'0001'
		Device Default	X'FFFF'
Special Handling	X'FO'	Specific Parameter (undefined by UP3i)	X'0000'–X'FFFE'
		Not Applicable	X'FFFF'

Note

1. Your printer must have the appropriate finishing hardware to perform finishing operations.
2. The default **OPERATION** is **ZFOLD**, and the default **REFERENCE** is **DEFAULT**.
3. Your print server may have a limit on the number of collection operations that can be open at one time.
4. For the finishing operation, changing the orientation of the medium presentation space does not change the finishing position. For instance the finishing reference edge (corner) is not affected by **DIRECTION** or **PRESENT** values.
5. If more than one finishing operation is specified, the operations are applied in the order in which they are specified. Identical finishing operations for the same **SCOPE** are not supported.

The following are examples of finishing operations:

1. **ZFOLD** pages (for which the xyz **COPYGROUP** is in effect), specifying the left edge of the document as the reference edge:

```
COPYGROUP xyz
FINISH OPERATION ZFOLD REFERENCE LEFT;
```

2. Three examples of **ZFOLD** pages that specify the default edge of the document:

```
COPYGROUP xyz FINISH;
```

or

```
COPYGROUP xyz FINISH OPERATION ZFOLD;
```

or

```
COPYGROUP xyz FINISH OPERATION ZFOLD REFERENCE DEFAULT;
```

3. An example of a **COPYGROUP** finishing command where **COPYGROUP** 1 begins the finishing collection for corner stapling, folding, and separation cut. **COPYGROUP** 2 continues the fold, cut, and corner operations and stops all other operations. **COPYGROUP** 3 continues any corner stapling, begins a new punch and fold group, and stops all other operations.

```
COPYGROUP 1
  FINISH
  SCOPE BEGCOLL OPERATION corner REFERENCE topleft
                    OPERATION fold
                    OPERATION cut;

COPYGROUP 2
  FINISH
  SCOPE CONTCOLL OPERATION fold
                    OPERATION cut
                    OPERATION corner;

COPYGROUP 3
  FINISH
  SCOPE CONTCOLL OPERATION corner REFERENCE topleft
  SCOPE BEGCOLL OPERATION punch
                    OPERATION fold;
```

4. An example of a **COPYGROUP** finishing command where **COPYGROUP** 1 begins a finishing collection for a punch, separation cut, and corner stapling (using the UP3i interface), and stops all other operations in progress. **COPYGROUP** 2 continues any UP3i corner stapling, but stops all other operations in progress. **COPYGROUP** 3 continues any UP3i corner stapling, stops all other operations in progress, and begins collecting sheets to punch and cut.

```
FORMDEF FinXmp Replace Yes;
```

```
COPYGROUP 1
  FINISH
  SCOPE BEGCOLL OPERATION punch
                    OPERATION cut
                    OPERATION UP3i XType 4 XOper 1 REFERENCE topleft;

COPYGROUP 2
  FINISH
  SCOPE CONTCOLL OPERATION UP3i XType 4 XOper 1 REFERENCE topleft;

COPYGROUP 3
  FINISH
  SCOPE CONTCOLL OPERATION UP3i
                    UP3i XType X'04' XOper X'0001' REFERENCE
                    topleft;
  SCOPE BEGCOLL OPERATION AFP punch
                    OPERATION cut;
```

5. Examples of **COPYGROUP** finishing commands with **PRESENT** and **DIRECTION**:

```
FORMEDF MOGD01 replace yes
  PRESENT landscape DIRECTION down ;
```

```

COPYGROUP cg00
  PRESENT portrait    DIRECTION across ;

COPYGROUP cg01
  PRESENT landscape  DIRECTION across ;

COPYGROUP cg02
  PRESENT portrait    DIRECTION reverse ;

COPYGROUP cg03
  PRESENT landscape  DIRECTION reverse ;

COPYGROUP cg04
  PRESENT portrait    DIRECTION down ;

COPYGROUP cg05
  PRESENT landscape  DIRECTION down ;

```

Finishing Operation Nesting Rules

When more than one finishing operation involving a collection of media is specified for some portion of the print file, a nesting of the operations is defined first by the scope of the operation and second by the order of the operation in the data stream.

Finishing operations with a broader scope are nested outside of finishing operations with a narrower scope. The following scopes are listed in descending order:

1. Print-file level finishing (**SCOPE PRINTFILE**)
2. Document-level finishing, each document in the print file (**SCOPE ALL**)
3. Document-level finishing, a selected document in the **PRINTFILE (SCOPE *n*)**
4. Medium-map-level finishing, a collection of sheets (**SCOPE BEGCOLL**)

Finishing Operation Implementation Notes

1. AFP environments limit the number of finishing operations that can be nested at the medium map (**COPYGROUP**) level. Check your PSF documentation for these limits.
2. In AFP environments, the nesting of identical finishing operations at the medium-map-level is not supported. Two finishing operations are identical if the **OPERATION**, **REFERENCE**, **OPCOUNT** or **OPPOS**, and **OPOFFSET** are the same.
3. For some printers, the **JOG** function cannot be combined with a finishing operation. In this case, the **JOG** function is ignored. Check your printer documentation.

ADJUST Subcommand

```
ADJUST n
```

Establishes the range of horizontal adjustment for the print area on the sheet.

n

The adjustment range can be set from 0 to 20 L-units. After a value is set, it is the maximum amount available in both directions, plus and minus.

↓ Note

1. If you specify **ADJUST**, the maximum logical page size (in the horizontal direction) is reduced by the amount you specified here.
2. The **ADJUST *n*** subcommand used only on the IBM 3800 printers.

INVOKE Subcommand

INVOKE {SHEET | NEXT | FRONT | BACK}

Specifies where the next page of data is placed when this copy group is activated by conditional processing or by an Invoke Medium Map structured field.

INVOKE SHEET, which is the default, places the next page of data on a new sheet. The **NEXT**, **FRONT**, and **BACK** parameters place the next page in a subsequent partition on the same sheet or, if no partitions are available, on the next sheet. If **FRONT** or **BACK** is specified, **INVOKE** selects only partitions on the front or back, respectively.

The print server honors the **NEXT**, **FRONT**, and **BACK** values of the **INVOKE** subcommand only if the new copy group has the same medium modifications as the previous copy group. Some examples of medium modifications are duplexing, input bin, output bin, page offset, N_UP values, presentation, direction, medium (not page) overlays, text suppression, processing functions, print quality, finishing, jogging, and constant forms control. See the Media Eject Control Triplet (X'45') section in the *Mixed Object Document Content Architecture Reference*, SC31–6802 for a full description of the factors that allow a conditional eject to the next partition instead of the next sheet.

If any of these modifications differ, the print server ejects to a new sheet when the copy group is invoked. If you want to change overlays when ejecting to a new partition, use page overlays instead of medium overlays. See [Medium Overlays and Page Overlays, p. 162](#) for information about page and medium overlays.

When you use **PLACE** subcommands, the **NEXT**, **FRONT**, and **BACK** parameters place the next page using the next sequential **PLACE** subcommand that matches the requirement (next, front, or back). For example, if you print using the second **PLACE** subcommand of copy group A, and then you change to copy group B, you start with the third **PLACE** subcommand of copy group B.

A **CONSTANT** parameter on the **PLACE** subcommand does not alter the selection process. The selection is complete, even though the selected **PLACE** subcommand does not place the data. **N_UP** performs the constant modification and continues until it finds a **PLACE** subcommand that does not specify **CONSTANT**. The data is placed with this subcommand. Observe that this **PLACE** subcommand need not match the **FRONT** or **BACK** specifications of the **INVOKE** subcommand.

SHEET

Specifies that data be placed in the first selected partition of the sheet.

NEXT

Specifies that data be placed in the next selected partition.

FRONT

Specifies that data be placed in the next selected front partition.

BACK

Specifies that data be placed in the next selected back partition.

JOG Subcommand

JOG {YES | NO}

Specifies whether a **JOG** subcommand is sent to the printer when this **COPYGROUP** is selected by an IMM structured field, or through conditional processing. When the **JOG** subcommand is sent, a printer either offsets (jogs) or prints copymarks. For cut-sheet printers, or for continuous-forms printers with burster-trimmer-stacker enabled, the **JOG** subcommand causes the first sheet controlled by this **COPYGROUP** to be stacked offset from the previous sheets. For continuous forms printers

without a burster-trimmer-stacker, the **JOG** subcommand causes an increment in the copymark printed on the carrier strip. **JOG** subcommands also are sent to the printer at the beginning of each data set or at the beginning of each job, depending on host parameters. For more information about copymarks, see the system programming guide for your host print server.

YES

Specifies that a **JOG** subcommand be sent to the printer. The first sheet printed is offset or the copymark is incremented.

NO

Specifies that no **JOG** subcommand be sent to the printer. The first sheet printed is not offset; the copymark is not incremented.

3

QUALITY Subcommand**QUALITY** *n*

Specifies the print quality. This subcommand is recognized only on printers that can produce more than one level of print quality. The default is determined by the printer model. (On some printers, the default may be set at the printer itself.) For more information, refer to your printer publications.

n

You can select a level of print quality by entering any whole number from 1 to 10. Higher numbers correspond to higher levels of print quality; lower numbers correspond to lower levels. For more information, refer to your printer publications.

Print quality is determined by a numerical code in the range of 1 to 254 (hexadecimal X'01'–X'FE'). The codes corresponding to the possible **QUALITY** parameters are:

- 1 = 15 (X'0F')
- 2 = 40 (X'28')
- 3 = 65 (X'41')
- 4 = 90 (X'5A')
- 5 = 115 (X'73')
- 6 = 140 (X'8C')
- 7 = 165 (X'A5')
- 8 = 190 (X'BE')
- 9 = 215 (X'D7')
- 10 = 240 (X'F0')

PROCESSING Subcommand**PROCESSING** [**MEDIA_INFO** {*n*... | **PERFORATE** | **CUT**}]...

Specifies additional post processing capabilities for selected printers and attached equipment. This option can only be used on a single sheet or collection of sheets. This subcommand expects 1 to 3 of the following keywords:

MEDIA_INFO *n*

This parameter specifies the ID of fixed medium information that a printer or printer-attached device applies to a sheet. Examples include color plates logos, letter heads, and other fixed images.

The numeric values that can be included are:

0–254

These numeric values select a particular fixed medium local ID that the printer or printer-attached device applies to a sheet. One or more IDs can be specified within this range.

255

This value selects all the current fixed medium local IDs that the printer or printer-attached devices applies to a sheet.

PERFORATE

Specifies a perforation cut at one or more fixed locations on the sheet according to the printer or printer-attached device.

CUT

Specifies a separation cut at one or more fixed locations on the sheet according to the printer or printer-attached device.

N_UP Subcommand

```
N_UP {1 | 2 | 3 | 4} [OVERLAY Subcommand... | PLACE Subcommand...]
```

Specifies the number of equal-size partitions into which the sheet is divided. See the [list of printers](#), that support the **N_UP** subcommand.

If you do not specify the **N_UP** subcommand in the **COPYGROUP** command, the **N_UP** subcommand from the **FORMDEF** command is the default for the **COPYGROUP** command. You can mix **N_UP** printing and non-**N_UP** printing by specifying or not specifying the **N_UP** subcommand in each copy group and by *not* specifying **N_UP** in the **FORMDEF** command.

OVERLAY Subcommand on N_UP Subcommand

```
OVERLAY name][rel-x rel-y][PARTITION]
[OVROTATE {0 | 90 | 180 | 270}][PF0]
```

Note

1. This **OVERLAY** subcommand cannot be specified if the **PLACE** subcommand is specified. Use the **OVERLAY** parameter of the **PLACE** subcommand instead.
2. You can specify a maximum of 254 **OVERLAY** subcommands in a copy group.

name

Specifies the user access name (up to six characters) of an overlay to be placed with every page in each of the **N_UP** partitions.

Note

1. The prefix "O1" is not part of the six-character user-access name. The overlay name can be an alphanumeric.
2. This name is not related to names as defined on the **OVERLAY** command.

rel-x rel-y

Specifies the horizontal and vertical adjustment to the position of the overlay. This is in addition to any offset values built into the overlay. The *x* and *y* values may be positive (+) or negative (-). You can specify them in inches (**IN**), millimeters (**MM**), centimeters (**CM**),

POINTS, or **PELS**. If you do not specify a unit value, PPFA uses the unit value specified in the last **SETUNITS** command or uses a default unit value of inches.

PARTITION

Specifies that the overlay is to be placed relative to the partition origin.

OVROTATE

Specifies the rotation of the placed overlay with respect to the x-axis of the page.

Example:

Assuming the overlay has (0,0) placement coordinates, this causes page overlay "O1x2" to be placed 1.5 inches to the right and 2.7 inches below the beginning of the page and rotated 90 degrees clockwise with respect to the page.

```
Formdef xmp1
  N_UP 1   PLACE 1 FRONT
           OVERLAY x2 1.5 in 2.7 in
           OVROTATE 90;
```

PFO

Specifies that this overlay is invoked as a PMC Printed Form Overlay. Only one PFO is allowed in an **N-UP** command.

PLACE Subcommand

```
PLACE n [FRONT | BACK] [CONSTANT]
[OFFSET rel-x rel-y]
Overlay Subcommand
[ROTATION {0 | 90 | 180 | 270}]
[VIEW {YES | NO}]
```

Places a page of data or a constant modification relative to a partition. Each **PLACE** subcommand specifies the number *n* of a partition on either the front or back side of the sheet. You must specify the same number of **PLACE** subcommands as the number of partitions on the sheet. The sequence of the **PLACE** subcommands is the sequence in which incoming pages are placed in the partitions.

Note

1. The use of the **PLACE** subcommand indicates enhanced N_UP printing.
2. The **PLACE** subcommand is valid only on printers that support enhanced **N_UP** printing. If **PLACE** is not specified, pages are placed in partitions in the default partition sequence.

n

Specifies the numbered partition (1–4) into which the page of data is placed. See [N_UP 1 Partition Numbering, Front Sheet-Side, p. 145](#) through [N_UP 4 Partition Numbering, Front Sheet-Side, p. 146](#) for the locale of each numbered partition.

FRONT

Specifies that this partition be placed on the front side of the sheet. This is the default.

BACK

Specifies that this partition be placed on the back side of the sheet.

CONSTANT

Specifies that no page data is placed by this **PLACE** subcommand.

Use **CONSTANT** when you are placing overlays without user's data or are placing fewer data pages on the sheet than the number of partitions specified in the **N_UP** subcommand.

For an example of using the **CONSTANT** parameter with overlays and to understand how the ordering of the **PLACE** subcommand affects overlays, see [Enhanced N_UP Example 3: Asymmetric Pages, p. 160](#).

OFFSET

Specifies a relative offset of the page horizontally (*x*) and vertically (*y*) from the partition origin.

rel-x rel-y

The default value is 0.1 inch for both *x* and *y* offsets. This **OFFSET** parameter overrides any other **OFFSET** parameters specified on the **FORMDEF** or **COPYGROUP** command. You can specify the units in inches (**in**), millimeters (**mm**), centimeters (**cm**), **points**, or **pels**. If you do not specify a unit value, PPFA uses the unit value specified in the last **SETUNITS** command or uses a default unit value of inches.

Note

You may specify this offset as negative in order to crop the top and/or left of an image.

OVERLAY Subcommand on PLACE Subcommand

```
OVERLAY name [rel-x rel-y] [PARTITION]
[OVROTATE {0 | 90 | 180 | 270}] [PFO]
```

Specifies the user access name (up to six characters) of an overlay to be placed with this **PLACE** subcommand. The overlay is placed relative to the page origin or, if the **PARTITION** keyword is specified, to the partition origin. You can specify multiple **OVERLAY** parameters in each **PLACE** subcommand.

rel-x rel-y

Specifies the horizontal and vertical adjustment to the position of the overlay. This is in addition to any offset values built into the overlay. The *x* and *y* values may be positive (+) or negative (-). You can specify them in inches (**in**), millimeters (**mm**), centimeters (**cm**), **points**, or **pels**. If you do not specify a unit value, PPFA uses the unit value specified in the last **SETUNITS, p. 264** command or uses a default value of inches.

PARTITION

Specifies that the previous offset is from the partition origin. If not present, the offset is from the page origin, which is subject to the **OFFSET** parameter.

OVROTATE {0 | 90 | 180 | 270}

Specifies the rotation of the placed overlay with respect to the X-axis of the page.

PFO

Specifies that this overlay is invoked as a PMC Printed Form Overlay. Only one PFO is allowed in a **PLACE**.

ROTATION {0 | 90 | 180 | 270}

Specifies the clockwise rotation of the page and associated page overlays placed by this **PLACE** command.

Rotation turns the page and its associated page overlays around their fixed origin points. If you rotate the page without moving its origin point, you might rotate it off the physical medium. To prevent this, always offset the page origin to the place you want it to be for the rotated page, as shown in the next figure.

3 Offsetting the Page Origin for Rotated Pages

VIEW

Determines if this **N_UP PLACE** page is viewable. **VIEW** is relevant only when the page is being presented on a display. **VIEW** is ignored if the page is being printed. If **VIEW** is not coded, it is equivalent to specifying **VIEW YES**.

YES

Specifies that this **N_UP** page is viewable and is presented.

NO

Specifies that this **N_UP** page is not to be presented.

PELSPERINCH Subcommand

PELSPERINCH *n*

Specifies the Logical Units in pels per inch for this **COPYGROUP**. Use the **PELSPERINCH** parameter to tell PPFA the pel resolution of your printer to generate more exact object placements.

n

Specifies an integer number between 1 and 3,276. This value determines the Logical Units in pels per inch.

Note

If the L-Units are not specified on the copy group, they are inherited from the form definition.

Form-size Parameters

```
[XMSIZE x [units]]
[YMSIZE y [units]]
```

Specifies the medium presentation space (also known as the medium size or form length and form width).

Note

1. This function requires both printer server and printer support. See your print server and printer documentation.
2. The printer will not adjust the size of your media-presentation space to be larger than the paper size (or what has been defined in the printer as the paper size).
3. Some printers (such as the InfoPrint 1145 and the InfoPrint 4100) do not support the IPDS "Set Media Size" (SMS) command. The form size cannot be set with the form definition. **Do not use the XMSIZE and YMSIZE subcommands for those printers that do not support the SMS commands.**
4. Other printers (such as the 6400, 4247, and 4230) do not support the "Set Media Origin" (SMO) command. The media origin does not change. **For the 6400, 4247, and 4230 printers form length is always YMSIZE and form width is always XMSIZE.**
5. For all other printers, use the settings shown in Table [Form Length \(LEN\) and Form Width \(WID\)](#), p. 234. For these other printers, whether the **XMSIZE** or **YMSIZE** is actually form length or form width depends on the medium presentation space orientation, type of form, and **N_UP** setting. The following examples are from Table [Form Length \(LEN\) and Form Width \(WID\)](#), p. 234. See the table for other media combinations.
 - Wide fanfold paper, **PRESENT=Landscape**, **DIRECTION=ACROSS**, and no-**NUP** - The form length is **YMSIZE**.
 - Narrow fanfold paper, **PRESENT=Landscape**, **DIRECTION=ACROSS**, and no-**NUP** - The form length is **XMSIZE**.
 - Cutsheet paper, **PRESENT=Landscape**, **DIRECTION=ACROSS**, and no-**NUP** - The form length is **XMSIZE**.
6. **There are only two choices. If you try one that doesn't work, try the other.** For example, if you try **XMSIZE** for the form length and it doesn't create a longer form, use **YMSIZE**.

XMSIZE

This specifies the medium presentation space along the X-axis (also known as the medium's size in the X-direction). If this subcommand is specified on the **FORMDEF** command, it becomes the default for all copygroups which do not specify **XMSIZE** on the **COPYGROUP** command. If this subcommand is not specified on the **FORMDEF** command, the printer's current default X-axis becomes the default for all copygroups which do not specify **XMSIZE** on the **COPYGROUP** command.

x

Enter a number with 0 to 3 decimal places and optional units.

YMSIZE

This specifies the medium presentation space along the Y-axis (also known as the medium's size in the Y-direction). If this subcommand is specified on the **FORMDEF** command, it becomes the default for all copygroups which do not specify **YMSIZE** on the **COPYGROUP**

command. If this subcommand is not specified on the **FORMDEF** command, the printer's current default Y-axis becomes the default for all copygroups which do not specify **YMSIZE** on the **COPYGROUP** command.

y

Enter a number with 0 to 3 decimal places and optional units.

units

Enter **IN** for inches, **CM** for centimeters, **MM** for millimeters, or **PELS** for pels. If *units* is not specified, the default is to the most recent setting of the **SETUNITS** command or inches if no **SETUNITS** command is coded.

3

Form Length (LEN) and Form Width (WID)

CUTSHEET and NARROW FANFOLD PAPER												
DIREC-TION	ACROSS				DOWN				REVERSE			
PRESENT	Portrait		Landscape		Portrait		Landscape		Portrait		Landscape	
	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID
No NUP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
1-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
2-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
3-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
4-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
WIDE FANFOLD PAPER												
DIREC-TION	ACROSS				DOWN				REVERSE			
PRESENT	Portrait		Landscape		Portrait		Landscape		Portrait		Landscape	
	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID
No NUP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
1-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
2-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
3-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
4-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm

Code Examples

```
FORMDEF FMSZX1  Replace Yes
PRESENT Landscape Direction Across
XMSIZE 8.5 in YMSIZE 11.0 in;
COPYGROUP cp1;
COPYGROUP cp2;

FORMDEF FMSZX2  Replace Yes YMSIZE 17.0 in;
COPYGROUP cp3;
COPYGROUP cp4;
```

In the previous example:

- The printer is a 4400 thermal printer which supports both SMS and SMO IPDS commands. The form definition named FMSZX1 defines a form length of 8.5 inches and form width of 11.0 inches. Copygroups "cp1" and "cp2" inherit those sizes from the form definition.
- The printer is a 6400 printer and you want to define the form length. The form definition named FMSZX2 defines form length as 17 inches and leaves the form width as the printer default. Copygroups "cp3" and "cp4" inherit those sizes from the form definition.
- If this is run on an MVS platform which has FORMLEN defined in the JCL, the JCL definition is used.

FORMDEF Command

```
FORMDEF name
[OFFSET rel-x rel-y] [rel-x rel-y]
[REPLACE {NO | YES}]
[[BIN 1] | [BIN {n | MANUAL | ENVELOPE} [MEDIANAME qstring] [COMPID m]]

```

OVERLAY Subcommand

```
OVERLAY name [rel-x rel-y] [PARTITION]
[OVROTATE {0 | 90 | 180 | 270}] [PFO]
```

PLACE Subcommand

```
PLACE n [FRONT | BACK] [CONSTANT] [OFFSET rel-x rel-y]
[OVERLAY Subcommand]
[ROTATION {0 | 90 | 180 | 270}]
[VIEW {YES | NO}]
```

Note

The use of the PLACE subcommand indicates enhanced N_UP printing.

Form-size Parameters

```
XMSIZE x {units} [YMSIZE y {units}];
```

A form definition is a resource that contains all the controls relating to the physical sheet. A **FORMDEF** command must be specified when you define a new form definition. When subcommands (except for the **REPLACE**, **PRESENT**, and **DIRECTION** subcommands) are specified, they become the defaults for all **COPYGROUP** commands nested within this form definition.

FORMDEF

Identifies the form definition to be used with the print job.

name

Defines an alphanumeric name of 1–6 characters for the form definition. When you create a form definition, PPFA assigns a prefix of F1 to the name you specify. F1nnnnn is the external resource name in the form-definition library.

Subcommands

OFFSET Subcommand

```
OFFSET rel-x rel-y [rel-x rel-y]
```

Specifies the relative offset of the logical page for both the front and back pages in reference to the media origin. The media origin is printer dependent. For more information about media origin, see your printer publications.

If you specify offset values for the back of the page, you must also specify the front offset values.

Note

1. The **OFFSET** subcommand does not affect the position of medium overlays.
2. You may specify this offset as negative in order to crop the top and/or left of an image.

rel-x

Specifies the relative horizontal offset (negative or positive) of the logical page on the front or back side of the copy group relative to the media origin. The valid options for *rel-x* are described in the **SETUNITS** command for the horizontal value.

The default unit is:

- Taken from the last **SETUNITS**, p. 264 command
- **IN** (inch) if no **SETUNITS** command has been issued

The default value is 0.1 IN.

rel-y

Specifies the relative vertical offset (negative or positive) for the logical page for the front or back side of the page. The valid options for *rel-y* are described in the **SETUNITS** command for the vertical value. The default unit is:

- Taken from the last **SETUNITS**, p. 264 command
- **IN** (inch) if no **SETUNITS** command has been issued

The default value is 0.1 IN.

 **Note**

The vertical offset for the 3800 must be 0.5 inch or greater.

3

REPLACE Subcommand

```
REPLACE {NO | YES}
```

Specifies whether this form definition is to replace an existing one with the same resource name in the library.

YES

Replace an existing form definition of the same name in the library if there is one. If a form definition with the same name does not exist in the library, then store this form definition.

NO

Do not replace an existing form definition of the same name. If a form definition with the same name does not exist in the library, then store this form definition. This is the default.

BIN Subcommand

```
[BIN 1] | [BIN {n | MANUAL | ENVELOPE}]  
[MEDIANAME qstring] [COMPID m]
```

Specifies the paper source. This subcommand should be used only for printers that have more than one paper source.

1

Selects the primary paper source.

n

Selects a paper source identified by an integer from 2–255. If the specified bin does not exist on your printer, the default paper source for that printer is used. For more information about paper sources on your printer, refer to your printer publications.

MANUAL

Selects manual feed as a paper source on those printers that support manual feed. For more information, refer to your printer publications.

ENVELOPE

Selects an envelope paper source on those printers that support this function. For more information, refer to your printer publications.

MEDIANAME

Selects a media source by specifying an agreed-upon name for the bin.

qstring

Up to 12 characters within single quotes, specifying the media source name. On some printers, this name is pre-set into the printer; on other printers, it can also be entered into the printer by the user. For a current list of the valid media names, see [PPFA Media Names, p. 476](#). Refer to your printer publications for further information.

COMPID

Selects a bin based on the component ID.

m

For a current list of component ids, see [PPFA Media Names, p. 476](#). Component ids from 12,288 to 268,435,455 are reserved for the user.

Note

1. **BIN** selection is overridden by the printer if the form defined to each bin is the same form number. Only the primary bin is selected.
2. The primary source usually contains either letter-size (U.S.) or A4 (I.S.O.) paper. Other paper sources are used for less common paper sizes (such as legal-size) and for special paper (such as colored stock or pre-printed letterhead on heavy bond).
3. If duplexing is requested and you select from the front side from one bin and the back side from another bin, a warning message is issued and the printer takes the paper from the bin specified on the front side.

OUTBIN Subcommand

OUTBIN *n*

Specifies the destination bin number for any pages directed by this form definition. Copygroups and subgroups in this form definition that do not specify an output bin number inherit this one.

n

Specifies the output bin number.

CONSTANT Subcommand

CONSTANT {**NO** | **BACK** | **FRONT** | **BOTH**}

Specifies whether the constant-forms function is on or off and whether constant form is to be printed on the front or back sides of a sheet.

NO

Specifies that the constant forms function is off.

BACK

Specifies that a constant form is to be printed on the back side without variable data.

FRONT

Specifies that a constant form is to be printed on the front side without variable data.

BOTH

Specifies that a constant form is to be printed on both sides without variable data.

CUTSHEET Subcommand

CUTSHEET {NO | YES}

If you are using a cut-sheet printer, this subcommand specifies whether the medium orientation information is to be passed to that printer. The medium orientation information is coded using the **DIRECTION** subcommand, the **PRESENT** subcommand, or both. Not coding the **CUTSHEET** subcommand is equivalent to coding **CUTSHEET NO**.

NO

Specifies the rotation data is not to be passed unless, of course, **N_UP** is coded.

YES

Specifies the rotation data is to be passed.

↓ Note

1. **As always:** If you have a continuous form printer, the medium orientation information is passed. If you have a cut-sheet printer and **N_UP** is coded, the orientation information is passed. The default for a **COPYGROUP** for which no **CUTSHEET** subcommand is coded is to inherit the behavior of the **FORMDEF**.
2. **New:** If you have a cut-sheet printer and **CUTSHEET YES** is coded, the orientation information is passed if you also have a level of print server that supports the **CUTSHEET** feature.
3. **In all cases:** Before using this command, you must have a printer that allows its media origin to be changed.

DIRECTION Subcommand

DIRECTION {ACROSS | DOWN | REVERSE}

Determines, along with the **PRESENT** subcommand, how data is oriented on printers whose media origin can be changed. See the list of printers [N_UP Printing, p. 143](#).

If you are printing line data, you usually specify the same value for the **DIRECTION** subcommand as is specified for the **DIRECTION** subcommand in the page definition.

ACROSS

Specifies that the pages are formatted in the **ACROSS** printing direction.

DOWN

Specifies that the pages are formatted in the **DOWN** printing direction.

REVERSE

Specifies that the pages are formatted in the **REVERSE** printing direction.

If the **DIRECTION** subcommand is specified, you must specify the **PRESENT** subcommand. The default for **DIRECTION** is determined by the value specified for **PRESENT**.

The direction default of **PORTRAIT** is **ACROSS**; the direction default of **LANDSCAPE** is **DOWN**. If neither **PRESENT** nor **DIRECTION** is specified, the default is **PRESENT PORTRAIT** and **DIRECTION ACROSS**.

Here are some examples of **FORMDEF** finishing commands with **PRESENT** and *DIRECTION*:

```
FORMDEF fd00
  PRESENT portrait DIRECTION across ;
FORMDEF fd01
  PRESENT landscape DIRECTION across ;
FORMDEF fd02
  PRESENT portrait DIRECTION reverse ;
FORMDEF fd03
  PRESENT landscape DIRECTION reverse ;
FORMDEF fd04
  PRESENT portrait DIRECTION down ;
FORMDEF fd05
  PRESENT landscape DIRECTION down ;
```

3

PRESENT Subcommand

PRESENT {PORTRAIT | LANDSCAPE}

Specifies, along with the **DIRECTION** subcommand, how the data is oriented on printers whose media origin can be changed.

The **PRESENT** and **DIRECTION** subcommands are only supported by cut-sheet printers when you specify the **N_UP** subcommand or the **CUTSHEET** subcommand with the **YES** parameter. See Figure [N_UP 1 Partition Numbering, Front Sheet-Side, p. 145](#) through Figure [N_UP 4 Partition Numbering, Front Sheet-Side, p. 146](#) to determine the effect of the **PRESENT** and **DIRECTION** subcommands when you use them with the **N_UP** subcommand.

PORTRAIT

Specifies that the pages are printed in the portrait page presentation, with their short edges at the top and bottom and their long edges at the sides.

LANDSCAPE

Specifies that the pages are printed in the landscape page presentation, with their long edges at the top and bottom and their short edges at the sides.

DUPLEX Subcommand

DUPLEX {NO | NORMAL | TUMBLE | RNORMAL | RTUMBLE}

Specifies whether printing is done on both sides of the sheet. This subcommand should be used only for page printers that have duplex capability.

NO

Duplex printing is not performed.

NORMAL

Duplex printing is performed, with the tops of both sides printed along the same edge for side binding.

TUMBLE

Duplex printing is performed with the top of one side and the bottom of the other printed along the same edge of the sheet for top binding.

RNORMAL

Rotated normal. Duplex printing is performed with the tops of both sides printed along the same edge. Used with landscape pages, **N_UP 2**, and **N_UP 3**.

RTUMBLE

Rotated tumble. Duplex printing is performed with the top of one side printed along the same edge of the sheet as the bottom of the other. Used with landscape pages, **N_UP 2**, and **N_UP 3**.

FINISH Subcommand

```
FINISH {SCOPE {PRINTFILE | ALL | n}[OPERATION Parameters]...
```

Specifies where the media should be stapled, folded, cut, or perforated.

This option is to be used only on a document, set of documents, or an entire print file. Finishing operations are device dependent; check your printer documentation before using the **FINISH** subcommand.

 **Note**

1. The **FINISH** operation is used for printers with finisher attachments.
2. The finishing operation must be specified at least once, and may occur more than once. It specifies finishing operations to be applied to the collected media.
3. If more than one finishing operation is specified, the operations are applied in the order in which they are specified. Identical finishing operations for the same **SCOPE** are not supported.
4. **FINISH** positions are not affected by **DIRECTION** or **PRESENT** values.
5. Changing the orientation of the medium presentation space does not change the finishing corners or edges.
6. For continuous forms media, the carrier strips are not considered to be part of the physical media.
7. For saddle stitch operation, the staples are placed along the center of the media, parallel to the reference edge. Any offset value is ignored. If no **OPCOUNT** or **OPPOS** values are specified, the device default count is used.
8. User-specified **OPCOUNT** and **OPPOS** values are ignored for **FOLD**, **CUT**, or **PERFORATE** operations.

SCOPE

Determines how the finishing operation is applied.

 **Note**

SCOPE can be repeated within a **FINISH** subcommand, but only one **SCOPE** of a particular type is allowed in each **FORMDEF** command. For example, only one **SCOPE ALL** is allowed in a **FORMDEF FINISH** command.

PRINTFILE

Determines that the specified finishing operations for the **OPERATION** subcommand are applied to the complete print file, excluding header pages, trailer pages, and message pages.

ALL

Determines that the specified finishing operations for the OPERATION subcommand are applied individually to all documents in the print file.

OPERATION Parameters

```
[[OPERATION CORNER AFP REFERENCE DEFAULT] |
[OPERATION [AFP] {CFOLDIN | CORNER | CUT | EDGE | FOLD | PERFECTBIND |
PERFORATE | PUNCH | RINGBIND | SADDLE[OUT] | SADDLEIN}
[More OPERATION parameters]
[UP3i XType {n | X'hh'}] [XOper {X'FFFF' | n | X'hhhh'}]
[More OPERATION parameters]]...
```

Specifies the type of **FINISH** operation and parameters.

Note

1. Compatible operations can be repeated with a specified **SCOPE**.
2. Your print server may have a limit on the number of collection operations allowed at one time.

AFP

Specifies that these are Advanced Function Presentation (AFP) operations as defined in the *Mixed Object Document Content Architecture Reference*, SC31-6802 and the *Intelligent Printer Data Stream Reference*, S544-3417.

CFOLDIN

Center Fold In. Specifies that the media is folded inward along the center line that is parallel to the finishing operation axis. After this operation, the back side of the last sheet of the collection is outside. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation. **CFOLDIN** is applied to collected media, not to individual media.

Note

The datastream pages must already be properly ordered for the **CFOLDIN** operation.

CORNER

Specifies that one staple is driven into the media at the reference corner (see **REFERENCE** parameter). For corner staples, the offset and angle of the staple from the selected corner is device dependent. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation. This operation is applied to collected media, not to individual media.

CUT

Specifies that a separation cut is applied to the media along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation.

EDGE

Specifies that one or more staples are driven into the media along the axis of the finishing operation. This operation is applied to collected media, not to individual media.

FOLD

Specifies that the media is folded along the axis of the finishing operation. The folding is performed along the axis of the finishing operation. The **OPOFFSET** and **OPPOS** parameters are ignored for this operation. This operation is applied to collected media, not to individual media.

PERFECTBIND

This operation specifies a type of book binding that glues the sheets of the group together at the reference edge (spine). When you specify **PERFECTBIND**, the **OPOFFSET**, **OPCOUNT**, and **OPPOS** parameters are ignored.

PERFORATE

Specifies that a perforation cut is applied to the media along the axis of the finishing operation. The **OPCOUNT** and **OPPOS** parameters are ignored for this operation.

PUNCH

Specifies that one or more holes are to be punched or drilled into the media along the finishing axis. **PUNCH** is applied to collected media, not to individual media.

RINGBIND

This operation specifies a type of book binding when the sheets of the group are loosely connected at the reference edge (spine) by first drilling or punching a set of holes along the reference edge and then inserting a wire pattern through the holes. When you specify **RINGBIND**, the **OPOFFSET**, **OPCOUNT**, and **OPPOS** parameters are ignored.

SADDLE or **SADDLEOUT**

Specifies that one or more staples are driven into the media along the axis of the finishing operation, which is positioned at the center of the media, parallel to the reference edge (see **REFERENCE** parameter). The **OPOFFSET** parameter is ignored for this operation. This operation also includes a fold of the media outward along the finishing operation axis so that the front side of the first sheet in the collection is on the outside of the media collection. This operation is applied to collected media, not to individual media.

SADDLEIN

Specifies that one or more staples are driven into the media along the axis of the finishing operation, which is positioned at the center of the media, parallel to the reference edge (see **REFERENCE** parameter). The **OPOFFSET** parameter is ignored for this operation. This operation also includes a fold of the media inward along the finishing operation axis so that the front side of the first sheet in the collection is on the inside of the media collection. This operation is applied to collected media, not to individual media.

UP3i

Specifies that these operations will be passed to the printer using the Universal Printer Pre- and Post-Processing Interface (UP3i) finishing interface as specified in the

“Form Finishing Operation Triplet” in the UP3i specification document. UP3i is an open standard intelligent interface intended for printers, pre-processors, post-processors, and other related applications.

Note

1. To use this function you must have printer server support as well as an attached UP3i device for the specified operation.
2. The complete UP3i specification document which includes the “Form Finishing Operation Triplet” is available at <https://www.afpconsortium.org/uploads/1/1/8/4/118458708/up3i-v1.20-3rd-party-specification.pdf>.

XType

Specifies the explicit value for the “Finishing Operation Type” in the UP3i Form Finishing Operation Triplet. Specify in hexadecimal or a decimal equivalent number the Finishing Operation Type. A value of 0 specifies a No Operation/Pass through paper operation. When 0 is coded in this field, the **XOper** field is ignored. Enter 2 hexadecimal digits or a decimal number less than or equal to 255.

XOper

Specifies the explicit value for the “Finishing Operation” or the “Finishing Operation Parameter” in the UP3i Form Finishing Operation Triplet. Specify in hexadecimal or a decimal equivalent number the Finishing Operation Type. A value of X'FFFF' specifies the device default operation for the specified finishing operation for the specified Finishing Operation Type in the **XType** parameter. Enter 4 hexadecimal digits or a decimal number less than or equal to 65535.

Note

1. PPFA does *not* check that the **XType**, **XOper**, or operation parameters are contextually correct. This allows new UP3i operations and parameters to be coded without having to install a new PPFA module. However, it also allows contextually incorrect operation and parameter values to be entered.
2. See Table [XType and XOper values](#), p. 222 for values of **XType** and **XOper**.

More OPERATION Parameters

OPERATION [REFERENCE { <u>DEFAULT</u> TOP BOTTOM LEFT RIGHT TOPLEFT TOPRIGHT BOTLEFT BOTRIGHT}] [OPCOUNT <i>n</i> OPPOS <i>n...</i>][OPOFFSET <i>n</i>

These operation parameters apply to both **AFP** and **UP3i** Operations with the noted exceptions.

REFERENCE

Selects the reference edge or corner for the finishing operation. The **REFERENCE** subcommand is optional and, when omitted, the **DEFAULT** attribute is the default.

DEFAULT

Specifies that the device default edge determines the reference edge.

TOP

Specifies that the reference is positioned along the top edge. This parameter can be used only for edge-type operations (for example, **SADDLE**, **EDGE**, **FOLD**, **CFOLDIN**, **PUNCH**, **SADDLEIN**, **CUT**, **PERFORATE**).

BOTTOM

Specifies that the reference edge is positioned along the bottom edge. This parameter can be used only for edge-type operations.

LEFT

Specifies that the reference edge is positioned along the left edge. This parameter can be used only for edge-type operations.

RIGHT

Specifies that the reference edge is positioned along the right edge. This parameter can be used only for edge-type operations.

TOPLEFT

Specifies that the reference corner is positioned at the top in the left corner. This parameter can be used only for **CORNER** operations.

TOPRIGHT

Specifies that the reference corner is positioned at the top in the right corner. This **REFERENCE** parameter can be used only for **CORNER** operations.

BOTLEFT

Specifies that the reference corner is positioned at the bottom in the left corner. This **REFERENCE** parameter can be used only for **CORNER** operations.

BOTRIGHT

Specifies that the reference corner is positioned at the bottom in the right corner. This **REFERENCE** parameter can be used only for **CORNER** operations.

OPCOUNT *n*

Use **OPCOUNT** to request a specific number of finishing operations; valid values are 1-122. Do not specify **OPPOS** values with **OPCOUNT**. If **OPPOS** is specified for corner staple, separation cut, perforation cut, or fold, this **OPCOUNT** value is ignored. The printer determines the positions of the operations. The default is **0** (zero).

OPPOS *n*

Use **OPPOS** to specify the offset of finishing operations along the finishing operations axis measured from the point where the finishing operation axis intersects the bottom edge or left edge of the medium toward the center of the medium. Each consecutive **OPPOS** parameter is used to position a single finishing operation centered on the specified point on the finishing operation axis.

For **AFP** the sub-parameter is an integer value in the range of 0–32,767 specified in millimeters.

For **UP3i** the sub-parameter is an integer value in the range of 0 to 999999999 specified in millipoints (1/72000 inch).

Do not specify the unit of measure. Do not specify **OPCOUNT** when you use **OPPOS**. If **OPPOS** is specified for corner staple, fold, separation cut, or perforation cut, the **OPCOUNT** value is ignored.

OPOFFSET *n*

Specifies the offset of finishing operation axis from the reference edge measured from the reference edge toward the center of the medium.

For **AFP** the sub-parameter is an integer value in the range of 0–32,767 specified in millimeters.

For **UP3i** the sub-parameter is an integer value in the range of 0 to 999999999 specified in millipoints (1/72000 inch).

Do not specify **OPOFFSET** for corner staple or saddle stitch; the corner staple or saddle stitch values are ignored when specified with **OPOFFSET**.

Examples of Specifying Finishing Operations

To request scope as the entire print job with one corner staple in the top left corner, specify:

```
FINISH SCOPE PRINTFILE OPERATION CORNER REFERENCE TOPLEFT;
```

You can specify multiple finishing operations. To request that the fifth document in the job stream be finished using top left corner staple and the ninth document be edge stitched only at the print default location, specify:

```
FINISH SCOPE 5
      OPERATION CORNER
      REFERENCE TOPLEFT
SCOPE 9
      OPERATION EDGE;
```

The following example requests that **SCOPE 5** (the fifth document in the job stream):

- Use the UP3i interface, be punched at the device default reference edge, and offset using the device default number and type of holes.
- Use the normal AFP interface to staple the top-left corner.

It also requests that **SCOPE 9** (the ninth document in the job stream):

- Use the UP3i interface to be trimmed on the front.
- Use the normal AFP interface to be edge stitched at the printer default location and offset using the device default number and type of staples.

```
FORMDEF FinSm2 Replace Yes
FINISH
  SCOPE 5 OPERATION UP3i XType X'0A'
          OPERATION CORNER REFERENCE TOPLEFT
  SCOPE 9 OPERATION UP3i XType 6 X0per 1
          OPERATION AFP EDGE;
```

Finishing Operation Nesting Rules

When more than one finishing operation involving a collection of media is specified for some portion of the print file, a nesting of the operations is defined first by the scope of the operation and second by the order of the operation in the data stream.

Finishing operations with a broader scope are nested outside of finishing operations with a narrower scope. The following scopes are listed in descending order:

1. Print-file level finishing (**SCOPE PRINTFILE**)
2. Document-level finishing, each document in the print file (**SCOPE ALL**)
3. Document-level finishing, a selected document in the **PRINTFILE (SCOPE *n*)**
4. Medium-map-level finishing, a collection of sheets (**SCOPE BEGCOLL**)

Finishing Operation Implementation Note

For some printers, the **JOG** function cannot be combined with a finishing operation. In this case, the **JOG** function is ignored. Check your printer documentation.

3

ADJUST Subcommand

```
ADJUST n
```

Establishes the range of horizontal adjustment for the print area on the sheet.

n

The adjustment range can be set from 0 to 20 L-units. The default is 0. After a value is set, it is the maximum amount available in both directions, plus and minus.

Note

1. If you specify **ADJUST**, the maximum logical page size (in the horizontal direction) is reduced by the amount you specified here.
2. The **ADJUST *n*** subcommand used only on the IBM 3800 printers.

INVOKE Subcommand

```
INVOKE {SHEET | NEXT | FRONT | BACK}
```

Specifies where the next page of data is placed when this copy group is activated by conditional processing or by an Invoke Medium Map structured field.

INVOKE SHEET, which is the default, places the next page of data on a new sheet. The **NEXT**, **FRONT**, and **BACK** parameters place the next page in a subsequent partition on the same sheet or, if no partitions are available, on the next sheet. If **FRONT** or **BACK** is specified, **INVOKE** selects only partitions on the front or back, respectively.

The print server honors the **NEXT**, **FRONT**, and **BACK** values of the **INVOKE** subcommand only if the new copy group has the same medium modifications as the previous copy group. Some examples of medium modifications are duplexing, input bin, output bin, page offset, N_UP values, presentation, direction, medium (not page) overlays, text suppression, processing functions, print quality, finishing, jogging, and constant forms control. See the Media Eject Control Triplet (X'45') section in the *Mixed Object Document Content Architecture Reference*, SC31–6802 for a full description of the factors that allow a conditional eject to the next partition instead of the next sheet.

If any of these modifications differ, the print server ejects to a new sheet when the copy group is invoked. If you want to change overlays when ejecting to a new partition, use page overlays instead of medium overlays. See [Medium Overlays and Page Overlays](#), p. 162 for information about page and medium overlays.

When you use **PLACE** subcommands, the **NEXT**, **FRONT**, and **BACK** parameters place the next page using the next sequential **PLACE** subcommand that matches the requirement (next, front, or back). For example, if you print using the second **PLACE** subcommand of copy group A, and then you change to copy group B, you start with the third **PLACE** subcommand of copy group B.

A **CONSTANT** parameter on the **PLACE** subcommand does not alter the selection process. The selection is complete, even though the selected **PLACE** subcommand does not place the data. **N_UP** performs the constant modification and continues until it finds a **PLACE** subcommand that does not specify **CONSTANT**. The data is placed with this subcommand. Observe that this **PLACE** subcommand need not match the **FRONT** or **BACK** specifications of the **INVOKE** subcommand.

SHEET

Specifies that data be placed in the first selected partition of the sheet.

NEXT

Specifies that data be placed in the next selected partition.

FRONT

Specifies that data be placed in the next selected front partition.

BACK

Specifies that data be placed in the next selected back partition.

JOG Subcommand

JOG {YES | NO}

Specifies whether a **JOG** subcommand is sent to the printer when this **FORMDEF** is selected by an IMM structured field, or through conditional processing. When the **JOG** subcommand is sent, a printer either offsets (jogs) or prints copymarks. For cut-sheet printers, or for continuous-forms printers with burster-trimmer-stacker enabled, the **JOG** subcommand causes the first sheet controlled by this **FORMDEF** to be stacked offset from the previous sheets. For continuous forms printers without a burster-trimmer-stacker, the **JOG** subcommand causes an increment in the copymark printed on the carrier strip. **JOG** subcommands also are sent to the printer at the beginning of each data set or at the beginning of each job, depending on host parameters. For more information about copymarks, see the system programming guide for your host print server.

YES

Specifies that a **JOG** subcommand be sent to the printer. The first sheet printed is offset or the copymark is incremented.

NO

Specifies that no **JOG** subcommand be sent to the printer. The first sheet printed is not offset; the copymark is not incremented.

QUALITY Subcommand

QUALITY *n*

Specifies the print quality. This subcommand is recognized only on printers that can produce more than one level of print quality. The default is determined by the printer model. (On some printers, the default may be set at the printer itself.) For more information, refer to your printer publications.

n

You can select a level of print quality by entering any whole number from 1 to 10. Higher numbers correspond to higher levels of print quality; lower numbers correspond to lower levels. For more information, refer to your printer publications.

Print quality is determined by a numerical code in the range of 1 to 254 (hexadecimal X'01'–X'FE'). The codes corresponding to the possible **QUALITY** parameters are:

- 1 = 15 (X'0F')
- 2 = 40 (X'28')
- 3 = 65 (X'41')
- 4 = 90 (X'5A')
- 5 = 115 (X'73')
- 6 = 140 (X'8C')
- 7 = 165 (X'A5')
- 8 = 190 (X'BE')
- 9 = 215 (X'D7')
- 10 = 240 (X'F0')

CMRTAGFIDELITY Subcommand

```
CMRTAGFIDELITY {STOP | {CONTINUE | {NOREPORT | REPORT}}
```

Specify the exception continuation and reporting rules for Color management resource (CMR) tag exceptions.

Note

See [AFP Color Management, p. 164](#) for more information about using the **CMRTAGFIDELITY** subcommand.

STOP

The CMR Tag exception rule is ““Stop presentation at point of first CMR tag exception and report the exception.”

CONTINUE

The CMR Tag exception rule is ““Do not stop presentation because of CMR tag exceptions and do one of the following:”

NOREPORT

Do not report the CMR tag exception to the print server. This is the default if neither **NOREPORT** nor **REPORT** is coded.

REPORT

Report the CMR tag exception.

PROCESSING Subcommand

```
PROCESSING [MEDIA_INFO {n... | PERFORATE | CUT}]...
```

Specifies additional post-processing capabilities for selected printers and attached equipment. This option can only be used on a single sheet or collection of sheets. This subcommand expects 1 to 3 of the following keywords:

MEDIA_INFO *n*

This parameter specifies the ID of fixed medium information that a printer or printer-attached device applies to a sheet. Examples include color plates logos, letter heads, and other fixed images.

The numeric values that can be included are:

0–254

These numeric values select a particular fixed medium local ID that the printer or printer-attached device applies to a sheet. One or more IDs can be specified within this range.

255

This value selects all the current fixed medium local IDs that the printer or printer-attached devices applies to a sheet.

PERFORATE

Specifies a perforation cut at one or more fixed locations on the sheet according to the printer or printer-attached device.

CUT

Specifies a separation cut at one or more fixed locations on the sheet according to the printer or printer-attached device.

COMMENT Subcommand

COMMENT *qstring...*

Specifies a string comment. Use **COMMENT** to mark a form definition with a user comment. The string is placed in the NOP structured field of the form definition.

qstring

Specifies a quoted set of strings up to a total of 255 characters.

↓ Note

In PPFA, a keyword or parameter (token) cannot extend across a line. Therefore, you must break the string into several strings in order to have a comment string that is longer than what fits on one line. Each string must be a complete token with beginning and ending quotes. For example:

```
FORMDEF replace yes
COMMENT 'first line of comment'
       'second line of comment';
```

PPFA composes the comment to be:

```
first line of comment second line of comment
```

and places it in a separate NOP structured field in the form definition.

COMPATPGP1 Subcommand

COMPATPGP1

Specifies that a Page Position structured field of type Format-1 (PGP-1) will be generated when a PGP of type Format-2 (PGP-2) is not required. A PGP-1 will be generated when all of the following conditions exist:

- The keyword **COMPATPGP1** is coded on the form definition.

- The form definition is simplex.
- The form definition is not enhanced **N_UP** (with the **PLACE** subcommand).
- The form definition is not simple **N_UP** (with the **PARTITION** subcommand).

Note

If it does not matter which internal structures PPFA uses, you do not need to use this function.

COMPIS3 Subcommand

COMPIS3

Specifies if the form definition created is compatible with the rules of MO:DCA Interchange Set 3, called IS/3. This parameter tells PPFA to use structured fields contained in IS/3 and to report errors for those PPFA parameters specified which are not compatible with IS/3.

Certain structured fields and keywords not compatible with the rules of the MO:DCA Interchange Set 3 are not allowed in the form definition. The following table indicates which PPFA parameters are not compatible with the rules of IS/3 and result in the error situations when **COMPIS3** is requested. To use the function associated with these parameters, do not specify **COMPIS3** on the **FORMDEF** command.

PPFA Parameters that Are Not Compatible with the Rules of IS/3

PPFA Command	Parameter
FORMDEF	ADJUST
	COMPATPGP1
	FINISH UP3i
	FONTFID
	PROCESSING
	QUALITY
	TONERSAVER
COPYGROUP	ADJUST
	FINISH UP3i
	PROCESSING
	QUALITY
OVERLAY	RASTER
RENDER	MONOCH
SUBGROUP	FLASH

Follow these steps to update an existing form definition to IS/3 format:

1. Add **COMPIS3** to the **FORMDEF** command.
2. Remove any parameters that are not compatible with IS/3 or that appear as IS/3 errors in the listing file messages.
3. Compile the form definition source using PPFA.

Note

PPFA does not make these changes directly when **COMPIS3** is specified.

PELSPERINCH Subcommand

PELSPERINCH *n*

Specifies the Logical Units in pels per inch for this form definition. Use the **PELSPERINCH** parameter to tell PPFA the pel resolution of your printer to generate more exact object placements.

n

Specifies an integer number between 1 and 3,276. This value determines the Logical Units in pels per inch.

Note

If the L-Units are not specified on the copy group, they are inherited from the form definition.

PELSPERINCH Example

```
FORMDEF xmp01 replace yes
  PELSPERINCH 300 ;

COPYGROUP C1
  offset 2 in 3 in;

COPYGROUP C2
  offset 2 in 3 in
  PELSPERINCH 1200;
```

In Figure [PELSPERINCH Example, p. 252](#), the form definition xmp01 has specified L-Units as 300 pels per inch. Because the COPYGROUP C1 does not specify L-Units, it inherits 300 pels per inch. COPYGROUP C2 does specify L-Units as 1200 pels per inch.

The code in COPYGROUP C1 (`offset 2 in 3 in`) produces internal and structured field values for *x* and *y* of 600 and 900, whereas in COPYGROUP C2 the same code produces values of 2400 and 3600, because of the difference in L-Units.

BINERROR Subcommand

BINERROR {**STOP** | **CONTINUE**}

Tells the printer whether or not you wish to stop printing if the wrong media is loaded on the printer or the bin number is not found.

This subcommand is displayed only on the **FORMDEF** command, not the **COPYGROUP** or the **SUBGROUP** commands, because the scope of the subcommand is throughout the form definition. Printing control is based on the status of the media loaded as it pertains to the **BIN** subcommand in effect at the time.

STOP

If the specified input bin is in error, stop the print job and hold it in a state from which it can be resubmitted.

CONTINUE

If the specified input bin is in error, continue printing using the printer default input bin.

COLORVALUERR Subcommand

COLORVALUERR {**STOP** | **CONTINUE** [**NOREPORT** | **REPORT**]}

Specifies what the printer should do when the form definition contains color values that the printer cannot render exactly as specified.

STOP

Specifies that an error should be issued by the printer and the job terminated if the printer encounters a color exception. A color exception occurs if the color specification in the data stream cannot be rendered as specified. Also, a color exception occurs if the host print server supports color fidelity and the target printer does not.

CONTINUE

Specifies that an exception condition should be ignored. Also, the printer substitutes colors for any that it cannot render, and the job continues.

NOREPORT

Specifies that the printer should not report the error. **NOREPORT** is the default if **COLORVALUERR CONTINUE** is coded and neither **REPORT** nor **NOREPORT** is coded.

REPORT

Specifies that the printer should report the error.

Note

When the printer encounters a color value exception, the following actions are taken:

- If the print server and the printer both support color fidelity and the **COLORVALUERR** subcommand is coded, printing stops or continues as previously described.
- If the print server and the printer both support color fidelity and the **COLORVALUERR** subcommand is not coded, the print server instructs the printer to reset to defaults at the beginning of the job.
- If the print server supports color fidelity, but the printer does not, the following rules apply:
 - If no **COLORVALUERR** subcommand is coded, printing continues. However, color exception errors are reported and ignored.
 - If the **COLORVALUERR** subcommand is not coded, you could receive print server errors or the command could be ignored, depending on the level of PSF you have installed and your platform (for example, OS/390, VM, and so on).
- If the printer supports color fidelity, but the print server does not, the following rules apply:
 - If no **COLORVALUERR** subcommand is coded, printing continues. Color exception errors are reported and ignored.
 - If either **COLORVALUERR STOP** or **COLORVALUERR CONTINUE NOREPORT** is coded, the print server issues an error and stops printing, even if there is no color exception error.
 - If **COLORVALUERR CONTINUE REPORT** is coded, printing continues. Color exception errors are reported and ignored.

FINERROR Subcommand

FINERROR {**STOP** | **CONTINUE** [**NOREPORT** | **REPORT**]}

If both the host PSF and target printer support finishing fidelity, the **FINERROR** subcommand on the **FORMDEF** command lets you control job continuation and error reporting. If a form definition requests a finishing operation that is not available with the printer, you may request that the job continue processing or cause it to stop printing.

FINERROR only covers operations that the printer cannot process; for example, a stapling operation has been specified on a device that is not equipped with a stapler. It does not cover temporary exceptions that require operator intervention, such as an empty stapler.

STOP

Specifies that the job should be terminated when the printer detects a finishing exception. A finishing exception that stops presentation is reported and the print file is held to be resubmitted when the finishing operation can be performed.

CONTINUE

Specifies that an exception condition should be ignored and that the job should continue without applying the unavailable finishing operation.

NOREPORT

Specifies that the printer should not report the error. **NOREPORT** is the default if **FINERROR CONTINUE** is coded and neither **REPORT** nor **NOREPORT** is coded.

REPORT

Specifies that the printer should report the error.

↓ Note

When the printer encounters a finishing exception, the following actions are taken:

- If the print server and the printer both support finishing fidelity and the **FINERROR** subcommand is coded, printing stops or continues as previously described.
- If the print server and the printer both support finishing fidelity and the **FINERROR** subcommand is not coded, the job is printed and the finishing operations that cannot be performed are not applied. Finishing exceptions are reported.
- If the print server supports finishing fidelity, but the printer does not, the following rules apply:
 - If you specify **FINERROR STOP**, the print server issues an error message and stops processing.
 - If you specify **FINERROR CONTINUE**, the print server prints the job and either issues a message if **REPORT** is specified or does not issue a message if **NOREPORT** is specified
- If the print server does not support finishing fidelity, the job is printed and the finishing operations that cannot be performed are not applied. Finishing exceptions are reported.

FINERROR Examples

```
FORMDEF xmp01 FINERROR STOP REPLACE YES;
  Copygroup X ... ;

FORMDEF xmp02 FINERROR Continue NoReport;
  Copygroup Y ... ;
```

Assuming that both the print server and the printer support finishing fidelity:

- In the first example, **FORMDEF xmp01** specifies a **STOP** parameter. If the specified finishing operation is not available, the printer reports an error, does not print the job, and places the job on hold to be resubmitted when the finishing operation can be performed.
- In the second example, **FORMDEF xmp02** specifies a **CONTINUE NOREPORT** parameter. If a specified finishing operation is not available, the printer continues processing the print job without applying the unavailable finishing operation or reporting the error.

FONTFID Subcommand

FONTFID {NO | YES}

Indicates to the print server whether the form definition honors the fidelity of the specified fonts when a raster font of a specified resolution and metric-technology cannot be found on the printer. In order to get the print server to honor this command you also must specify font resolution either on the **FONT** command or externally (for example, in the JCL). Not coding **FONTFID** is equivalent to coding **FONTFID NO**.

NO

Specifies that the print server will not enforce font fidelity. The print server does not check for a match of the specified resolution and metric with the font found on the system.

YES

Specifies that no substitution is allowed and the print server issues an error message if it cannot find the font that matches the specified resolution and metric.

↓ Note

1. The **FONTFID** subcommand is designed to be used with the **RESOLUTION** and **METRICTECHNOLOGY** subcommands on the **FONT** command. These subcommands rigorously specify the font characteristics.
2. The **FONTFID** subcommand assists the user who has created a form definition and page definition for printing with a raster font on a printer of one resolution (for example, a 240-pel printer), and has moved that application to a printer of another resolution (for example, a 300-pel printer). When the print server cannot match the raster font, it substitutes an outline font, which often causes the placed text to overflow or underflow the intended space on the page. If this happens, the user can specify the actual metric and resolution of the font being used to print the text and also specify **FONTFID YES**, so that the print server would not substitute another font.

TONERSAVER Subcommand

TONERSAVER {DEVSETTING | OFF | ON}

Specifies whether or not the printer's toner saver mode should be activated.

DEVSETTING

Use the printer setting.

OFF

Do not activate toner saver mode.

ON

Activate toner saver mode.

Note

1. Not all printers support toner saver mode. Check the printer's documentation.
2. Activating toner saver mode can degrade print quality and performance.
3. **OFF** and **ON** override any **QUALITY** parameters.

N_UP Subcommand

```
N_UP [1 | 2 | 3 | 4] [OVERLAY Subcommand... | PLACE Subcommand...]
```

Specifies the number of equal-size partitions into which the sheet is divided. See the [list of printers](#), that support the **N_UP** subcommand.

If you do not specify the **N_UP** subcommand in the **COPYGROUP** command, the **N_UP** subcommand from the **FORMDEF** command is the default for the **COPYGROUP** command. You can mix **N_UP** printing and non-**N_UP** printing by specifying or not specifying the **N_UP** subcommand in each copy group and by *not* specifying **N_UP** in the **FORMDEF** command.

OVERLAY Subcommand on N_UP Subcommand

```
OVERLAY name][rel-x rel-y][PARTITION]  
[OVROTATE {0 | 90 | 180 | 270}][PF0]
```

Note

This **OVERLAY** subcommand cannot be specified if the **PLACE** subcommand is specified. Use the **OVERLAY** parameter of the **PLACE** subcommand instead.

name

Specifies the user access name (up to six characters) of an overlay to be placed with every page in each of the **N_UP** partitions.

Note

1. The prefix "O1" is not part of the six-character user-access name. The overlay name can be an alphanumeric.
2. This name is not related to names as defined on the **OVERLAY** command.

rel-x rel-y

Specifies the horizontal and vertical adjustment to the position of the overlay. This is in addition to any offset values built into the overlay. The *x* and *y* values may be positive (+) or negative (-). You can specify them in inches (**IN**), millimeters (**MM**), centimeters (**CM**), **POINTS**, or **PELS**. If you do not specify a unit value, PPFA uses the unit value specified in the last **SETUNITS** command or uses a default unit value of inches.

PARTITION

Specifies that the overlay is to be placed relative to the partition origin.

OVROTATE

Specifies the rotation of the placed overlay with respect to the x-axis of the page.

Example:

Assuming the overlay has (0,0) placement coordinates, this causes page overlay "O1x2" to be placed 1.5 inches to the right and 2.7 inches below the beginning of the page and rotated 90 degrees clockwise with respect to the page.

```
Formdef xmp1
  N_UP 1 PLACE 1 FRONT
        OVERLAY x2 1.5 in 2.7 in
        OVROTATE 90;
```

PFO

Specifies that this overlay is invoked as a PMC Printed Form Overlay. Only one PFO is allowed in an **N_UP** command.

PLACE Subcommand

```
PLACE n [FRONT | BACK] [CONSTANT]
[OFFSET rel-x rel-y]
Overlay Subcommand
[ROTATION {0 | 90 | 180 | 270}]
[VIEW {YES | NO}]
```

Places a page of data or a constant modification relative to a partition. Each **PLACE** subcommand specifies the number *n* of a partition on either the front or back side of the sheet. You must specify the same number of **PLACE** subcommands as the number of partitions on the sheet. The sequence of the **PLACE** subcommands is the sequence in which incoming pages are placed in the partitions.

Note

1. The use of the **PLACE** subcommand indicates enhanced N_UP printing.
2. The **PLACE** subcommand is valid only on printers that support enhanced **N_UP** printing. If **PLACE** is not specified, pages are placed in partitions in the default partition sequence.

n

Specifies the numbered partition (1–4) into which the page of data is placed. See [N_UP 1 Partition Numbering, Front Sheet-Side, p. 145](#) through [N_UP 4 Partition Numbering, Front Sheet-Side, p. 146](#) for the locale of each numbered partition.

FRONT

Specifies that this partition be placed on the front side of the sheet. This is the default.

BACK

Specifies that this partition be placed on the back side of the sheet.

CONSTANT

Specifies that no page data is placed by this **PLACE** subcommand.

Use **CONSTANT** when you are placing overlays without user's data or are placing fewer data pages on the sheet than the number of partitions specified in the **N_UP** subcommand.

For an example of using the **CONSTANT** parameter with overlays and to understand how the ordering of the **PLACE** subcommand affects overlays, see [Enhanced N_UP Example 3: Asymmetric Pages, p. 160](#).

OFFSET

Specifies a relative offset of the page horizontally (*x*) and vertically (*y*) from the partition origin.

rel-x rel-y

The default value is 0.1 inch for both *x* and *y* offsets. This **OFFSET** parameter overrides any other **OFFSET** parameters specified on the **FORMDEF** or **COPYGROUP** command. You can specify the units in inches (**in**), millimeters (**mm**), centimeters (**cm**), **points**, or **pels**. If you do not specify a unit value, PPFA uses the unit value specified in the last **SETUNITS** command or uses a default unit value of inches.

↓ Note

You may specify this offset as negative in order to crop the top and/or left of an image.

OVERLAY Subcommand on PLACE Subcommand

```
OVERLAY name [rel-x rel-y] [PARTITION]
[OVROTATE {0 | 90 | 180 | 270}] [PFO]
```

Specifies the user access name (up to six characters) of an overlay to be placed with this **PLACE** subcommand. The overlay is placed relative to the page origin or, if the **PARTITION** keyword is specified, to the partition origin. You can specify multiple **OVERLAY** parameters in each **PLACE** subcommand.

rel-x rel-y

Specifies the horizontal and vertical adjustment to the position of the overlay. This is in addition to any offset values built into the overlay. The *x* and *y* values may be positive (+) or negative (-). You can specify them in inches (**in**), millimeters (**mm**), centimeters (**cm**), **points**, or **pels**. If you do not specify a unit value, PPFA uses the unit value specified in the last **SETUNITS**, p. 264 command or uses a default value of inches.

PARTITION

Specifies that the previous offset is from the partition origin. If not present, the offset is from the page origin, which is subject to the **OFFSET** parameter.

OVROTATE {0 | 90 | 180 | 270}

Specifies the rotation of the placed overlay with respect to the X-axis of the page.

PFO

Specifies that this overlay is invoked as a PMC Printed Form Overlay. Only one PFO is allowed in a **PLACE**.

ROTATION {0 | 90 | 180 | 270}

Specifies the clockwise rotation of the page and associated page overlays placed by this **PLACE** command.

Rotation turns the page and its associated page overlays around their fixed origin points. If you rotate the page without moving its origin point, you might rotate it off the

physical medium. To prevent this, always offset the page origin to the place you want it to be for the rotated page, as shown in the next figure.

Offsetting the Page Origin for Rotated Pages

VIEW

Determines if this **N_UP PLACE** page is viewable. **VIEW** is relevant only when the page is being presented on a display. **VIEW** is ignored if the page is being printed. If **VIEW** is not coded, it is equivalent to specifying **VIEW YES**.

YES

Specifies that this **N_UP** page is viewable and is presented.

NO

Specifies that this **N_UP** page is not to be presented.

VFYSETUP or VFYSETUPD Subcommand

[VFYSETUP *verificationID...* | VFYSETUPD *decimal_verificationID...*]

Use **VFYSETUP** or **VFYSETUPD** to propagate the setup IDs to all medium maps (copygroups) in the form definition.

↓ Note

Before using these subcommands, verify that your print server supports **FORMDEF** setup verification.

verificationID...

One or more 2-character (4-digit hexadecimal) identifiers that match the setup verification IDs defined at the printer operator's console for the specific print job. For example, if the setup verification IDs defined at the printer are X'012F', X'0521', and X'938A', specify the following:

```
FORMDEF vfy7 REPLACE YES VFYSETUP 012F 0521 938A;
```

decimal_verificationID...

One or more decimal numbers that match the setup verification IDs defined at the printer operator's console for the specific print job. For example, if the setup verification IDs defined at the printer are 303, 1313, and 37770, specify the following:

```
FORMDEF vfy7 REPLACE YES VFYSETUPD 303 1313 37770;
```

When the print server processes the print job, it compares the setup verification IDs in the form definition to the IDS that are active in the printer. If the active IDs in the printer do not match the IDs required by the form definition, or if the printer does not support **FORMDEF** setup verification IDs, the job is held.

TEXTERROR Subcommand

```
TEXTERROR {STOP | CONTINUE [NOREPORT | REPORT]}
```

Specifies what happens when the printer encounters a text exception (a text control sequence that it doesn't recognize). Make sure that the printer and print server both support text fidelity before you use this subcommand.

STOP

The printer terminates the job and reports the text exception. The print file is put into a state where it can be resubmitted when the text can be rendered without exceptions.

CONTINUE

The printer skips the text control sequence that it does not recognize and continues processing the print job.

NOREPORT

The printer does not report the error. This is the default.

REPORT

The printer reports the error.

Form-size Parameters

```
[XMSIZE x [units]]  
[YMSIZE y [units]]
```

Specifies the medium presentation space (also known as the medium size or form length and form width).

 Note

1. This function requires both printer server and printer support. See your print server and printer documentation.
2. The printer will not adjust the size of your media-presentation space to be larger than the paper size (or what has been defined in the printer as the paper size).
3. Some printers (such as the InfoPrint 1145 and the InfoPrint 4100) do not support the IPDS "Set Media Size" (SMS) command. The form size cannot be set with the form definition. **Do not use the XMSIZE and YMSIZE subcommands for those printers that do not support the SMS commands.**
4. Other printers (such as the 6400, 4247, and 4230) do not support the "Set Media Origin" (SMO) command. The media origin does not change. **For the 6400, 4247, and 4230 printers form length is always YMSIZE and form width is always XMSIZE.**
5. For all other printers, use the settings shown in Table [Form Length \(LEN\) and Form Width \(WID\)](#), p. 262. For these other printers, whether the **XMSIZE** or **YMSIZE** is actually form length or form width depends on the medium presentation space orientation, type of form, and **N_UP** setting. The following examples are from Table [Form Length \(LEN\) and Form Width \(WID\)](#), p. 262. See the table for other media combinations.
 - Wide fanfold paper, **PRESENT=Landscape**, **DIRECTION=ACROSS**, and no-**NUP** - The form length is **YMSIZE**.
 - Narrow fanfold paper, **PRESENT=Landscape**, **DIRECTION=ACROSS**, and no-**NUP** - The form length is **XMSIZE**.
 - Cutsheet paper, **PRESENT=Landscape**, **DIRECTION=ACROSS**, and no-**NUP** - The form length is **XMSIZE**.
6. **There are only two choices. If you try one that doesn't work, try the other.** For example, if you try **XMSIZE** for the form length and it doesn't create a longer form, use **YMSIZE**.

XMSIZE

This specifies the medium presentation space along the X-axis (also known as the medium's size in the X-direction). If this subcommand is specified on the **FORMDEF** command, it becomes the default for all copygroups which do not specify **XMSIZE** on the **COPYGROUP** command. If this subcommand is not specified on the **FORMDEF** command, the printer's current default X-axis becomes the default for all copygroups which do not specify **XMSIZE** on the **COPYGROUP** command.

x

Enter a number with 0 to 3 decimal places and optional units.

YMSIZE

This specifies the medium presentation space along the Y-axis (also known as the medium's size in the Y-direction). If this subcommand is specified on the **FORMDEF** command, it becomes the default for all copygroups which do not specify **YMSIZE** on the **COPYGROUP** command. If this subcommand is not specified on the **FORMDEF** command, the printer's current default Y-axis becomes the default for all copygroups which do not specify **YMSIZE** on the **COPYGROUP** command.

y

Enter a number with 0 to 3 decimal places and optional units.

units

Enter **IN** for inches, **CM** for centimeters, **MM** for millimeters, or **PELS** for pels. If *units* is not specified, the default is to the most recent setting of the **SETUNITS** command or inches if no **SETUNITS** command is coded.

Form Length (LEN) and Form Width (WID)

CUTSHEET and NARROW FANFOLD PAPER												
DIREC-TION	ACROSS				DOWN				REVERSE			
PRESENT	Portrait		Landscape		Portrait		Landscape		Portrait		Landscape	
	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID
No NUP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
1-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
2-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
3-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
4-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
WIDE FANFOLD PAPER												
DIREC-TION	ACROSS				DOWN				REVERSE			
PRESENT	Portrait		Landscape		Portrait		Landscape		Portrait		Landscape	
	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID	LEN	WID
No NUP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
1-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm
2-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
3-UP	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym
4-UP	Xm	Ym	Ym	Xm	Ym	Xm	Xm	Ym	Xm	Ym	Ym	Xm

Code Examples

```
FORMDEF FMSZX1  Replace Yes
  PRESENT landscape Direction Across
  XMSIZE 8.5 in YMSIZE 11.0 in;
COPYGROUP cp1;
COPYGROUP cp2;

FORMDEF FMSZX2  Replace Yes YMSIZE 17.0 in;
COPYGROUP cp3;
COPYGROUP cp4;
```

In the previous example:

- The printer is a 4400 thermal printer which supports both SMS and SMO IPDS commands. The form definition named FMSZX1 defines a form length of 8.5 inches and form width of 11.0 inches. Copygroups "cp1" and "cp2" inherit those sizes from the form definition.

- The printer is a 6400 printer and you want to define the form length. The form definition named FMSZX2 defines form length as 17 inches and leaves the form width as the printer default. Copygroups "cp3" and "cp4" inherit those sizes from the form definition.
- If this is run on an MVS platform which has FORMLEN defined in the JCL, the JCL definition is used.

OVERLAY Command

OVERLAY Command

```
OVERLAY [name1] name2 {NORASTER | RASTER} ;
```

This **OVERLAY** command identifies an electronic *medium overlay* to be used in one or more subgroups of a copy group. See [Medium Overlays and Page Overlays, p. 162](#) for additional information. When using the **OVERLAY** command, follow these guidelines:

- An **OVERLAY** command comes after the **COPYGROUP** command.
- A separate **OVERLAY** command must be specified for each electronic overlay used in a subgroup.
- A maximum of 254 **OVERLAY** commands can be specified for coded overlays per copy group.
- The overlay named here must be referenced in a **SUBGROUP** command in order to be printed.

Note

1. Overlays contain their own positioning controls.
2. This command does not define *page overlays*, that are placed using the **N_UP** subcommand. See [Medium Overlays and Page Overlays, p. 162](#) for additional information.

OVERLAY

Identifies an electronic overlay to be used in one or more subgroups of a copy group.

name1

Specifies an alphanumeric name of 1 to 16 characters (local name) for the overlay. It must conform to the token rules and must be unique within a copy group.

Note

If *name1* is omitted, *name2* is used as the local name and is the name used in the subgroup command.

name2

Specifies an alphanumeric name of 1 to 6 characters (user-access name) for this overlay. A prefix of "O1" is added by PPFA to identify the overlay resource.

Subcommand

RASTER or NORASTER Subcommand

```
[RASTER | NORASTER]
```

Specifies overlays as raster or non-raster data.

Note

The **RASTER** and **NORASTER** subcommands are used only on the IBM 3800 printers.

RASTER

Specifies this overlay is to be kept in the printer as raster data. If this overlay is to be used several times, the printer does not need to recompile it each time.

NORASTER

Specifies this is a coded overlay. A maximum of 254 coded overlays can be specified per copy group.

3

SETUNITS Command

```
SETUNITS [ 1 IN 1 IN ] |
x { IN | MM | CM | POINTS | PELS | CPI }
y { IN | MM | CM | POINTS | PELS | LPI }
LINESP n { IN | MM | CM | POINTS | PELS | LPI } ;
```

The **SETUNITS** command specifies the value and the unit of measurement that is the default for any subsequent measurement parameter in all of the commands and subcommands. These values remain the default values until another **SETUNITS** command is specified. The **SETUNITS** command should be specified as the first command in a form definition. If neither this command nor a measurement parameter is specified, the defaults identified within the following description are used.

SETUNITS

Specifies the value and the unit of measurement that is the default for any subsequent measurement parameter in all of the commands and subcommands.

x-pos

Specifies the number used for horizontal measurement. A number with up to three decimal places may be used. The unit choices are **IN**, **MM**, **CM**, **POINTS**, **PELS**, or **CPI**. The default is **1 IN**.

Note

This value affects subsequent **OFFSET** subcommands.

y-pos

Specifies the number used for vertical measurement. A number with up to three decimal places may be used. The unit choices are **IN**, **MM**, **CM**, **POINTS**, **PELS**, or **LPI**. The default is **1 IN**.

Note

This value affects subsequent **OFFSET** subcommands.

Using CPI and LPI Units of Measurement

The **CPI** and **LPI** units of measurement make it possible to write the following command:

```
SETUNITS 10 CPI 6 LPI ;
```

This command sets the units of measurement for horizontal and vertical spacing in terms of characters per inch and lines per inch. You can then use the **OFFSET** subcommand specifications to

increment the spacing one character or one line at a time. The distance specified by *n* characters over and by *n* lines down is defined in the governing **SETUNITS** command. In this example, there are 10 characters per inch (**CPI**) and 6 lines per inch (**LPI**).

Subcommand

LINESP Subcommand

```
LINESP n
```

This subcommand is to be used within a page definition to set up default line spacing. It serves no purpose when used within a form definition.

SUBGROUP Command

```
SUBGROUP
[COPIES n]
[FLASH {NO | YES}]
[BOTH | BACK | FRONT]
[[BIN 1] | [BIN {n | MANUAL | ENVELOPE} [MEDIANAME qstring] [COMPID m]]
[OUTBIN n]
[OVERLAY name PFO]
[SUPPRESSION name...] ;
```

The **SUBGROUP** command specifies the number of copies of a single page that are to be printed and any modifications (consisting of overlays, suppressions, type of duplexing, and forms flash) to be made to the copies. A **SUBGROUP** command follows a **COPYGROUP**, p. 210 command. A maximum of 127 **SUBGROUP** commands can be specified within each copy group.

Note

1. The **BOTH** subcommand causes two subgroups to be generated. Thus, a maximum of 63 subgroups can be specified when the **BOTH** subcommand is used.
2. When you specify the **DUPLEX** subcommand (with a parameter other than **NO**) in the **COPYGROUP** command, you must include one **SUBGROUP** command for each side of a sheet, or you may specify the **BOTH** subcommand in a single **SUBGROUP** command.

Subcommands

COPIES Subcommand

```
COPIES n
```

Specifies how many copies of each page are to be printed.

n

Defines the number of copies (the maximum number is 255). When **BACK** is specified within a **SUBGROUP** command, the system counts the front pages printed (the actual number of sheets) not copies made (front and back). The default is **1**.

FLASH Subcommand

FLASH {NO | YES}

Specifies whether to use forms flash.

Note

1. The **FLASH** subcommand is used only on IBM 3800 printers.
2. When forms flash is used, its name must be specified in the job control language for the print job. The operator must place the correct negative into the 3800 when the job is ready to print.

NO

Specifies that forms flash does not occur.

YES

Specifies that forms flash occurs.

BACK or FRONT or BOTH Subcommand**{BOTH | BACK | FRONT}**

These optional subcommands specify whether the subgroup is for both sides of a sheet or for only the front or the back side.

Note

1. Subgroups must specify **FRONT** and **BACK** if an overlay, suppression, or forms flash appears on one side but not on the other.
2. The **FRONT** and **BACK** subgroups must have the same number of copies. If the number of copies differs, the **COPIES** parameter of the **BACK** subgroup is ignored, and a warning message is issued.
3. The **FRONT** and **BACK** subcommands must occur in pairs.
4. If the **FRONT** and **BACK** subcommands are specified with **DUPLEX NO** (in the **FORMDEF** or **COPYGROUP** commands), PPFA issues an error message and does not create the form definition.

BACK

Specifies that this **SUBGROUP** command is for the back sides of the sheets.

A subgroup with a **BACK** subcommand must have a **FRONT** subcommand in the preceding subgroup.

FRONT

Specifies that this subgroup is for the front sides of the sheets.

If a **DUPLEX** subcommand in a **FORMDEF** or **COPYGROUP** command is specified with a parameter other than **NO** and the **FRONT** subcommand is specified in a **SUBGROUP** command, the next **SUBGROUP** command must have a **BACK** subcommand.

BOTH

Specifies that this subgroup is used for both sides of the sheet.

This is the default when **DUPLEX** is specified in the copy group.

If **BOTH** is specified with **DUPLEX NO** (in a **FORMDEF** or **COPYGROUP** command), PPFA issues a warning message and ignores the **BOTH** subcommand.

BIN Subcommand

```
[[BIN n] | [BIN {n | MANUAL | ENVELOPE} [MEDIANAME qstring] [COMPID m]]
```

Specifies the paper source. This subcommand should be used only for printers that have more than one paper source.

Note

If you specify the **BIN** subcommand, you must also specify at least one of the legal parameters.

n

An integer between 1 and 255 that is the Media Source Id (also known as the bin number).

1

Selects the primary paper source.

2–255

Selects another paper source. If the specified bin does not exist on your printer, the default paper source for that printer is used. For more information about paper sources on your printer, refer to your printer publications. Using a value of **100** is the same as specifying **MANUAL**.

MANUAL

Selects manual feed as a paper source on those printers that support manual feed. For more information, refer to your printer publications.

ENVELOPE

Selects an envelope paper source on those printers that support this function. For more information, refer to your printer documentation.

Note

1. Bin selection is overridden by the printer if the form defined to each bin is the same form number. Only the primary bin is selected.
2. The primary source usually contains either letter-size (U.S.) or A4 (I.S.O.) paper. Other paper sources are used for less common paper sizes (such as legal-size) and for special paper (such as colored stock or pre-printed letterhead on heavy bond).
3. If duplexing is requested and you select from the front side from one bin and the back side from another bin, a warning message is issued and the printer takes the paper from the bin specified on the front side.

MEDIANAME

Selects a media source by specifying an agreed-upon name for the bin. For a current list of the valid media names, see [PPFA Media Names, p. 476](#).

qstring

Up to 12 characters within single quotes specifying the media source name. On some printers, this name is pre-set into the printer; on others, it also can be entered

into the printer by the user. Refer to your printer documentation for further information.

COMPID *m*

Selects a bin based on the component ID.

↓ Note

For a current list of component ids, see [PPFA Media Names, p. 476](#). Component ids from 12,288 to 268,435,455 are reserved for the user.

OUTBIN Subcommand

OUTBIN *n*

Specifies the destination bin number for any pages directed by this form definition. Copygroups and subgroups in this form definition that do not specify an output bin number inherit this bin number.

OVERLAY Subcommand

OVERLAY *name...*

Specifies the electronic overlays that are to be used with this subgroup.

name

Specifies either the local or user-access name. A maximum of eight names can be specified within a subgroup.

PFO

Specifies that this overlay is invoked as a Medium Printed Form Overlay. Only one PFO is allowed in a subgroup. A subgroup PFO can not be specified along with an **N_UP** PFO,

↓ Note

1. If the local name is used, it must be defined in an **OVERLAY** command before it can be referenced.
2. PPFA does not check for duplicate user-access names.

SUPPRESSION Subcommand

SUPPRESSION *name...*

Specifies that the named fields are suppressed. These must be text-only fields.

name

Specifies a alphanumeric name of 1 to 8 characters (local name) of the text field to be suppressed. A maximum of eight names can be specified within a subgroup.

The suppression field named here must be defined in a **SUPPRESSION** command following the **FORMDEF** command before it can be referenced. See [SUPPRESSION Command, p. 268](#).

SUPPRESSION Command

SUPPRESSION *name ;*

The **SUPPRESSION** command names the suppression that is specified in the **FIELD** command of a page definition associating the form definition and the page definition. The **SUPPRESSION** command, if used, must immediately follow the **FORMDEF** command.

name

Identifies an alphanumeric name of 1 to 8 characters (local name). The name must conform to the token rules.

You must specify the area to be suppressed in a **FIELD** command or a **SUBGROUP** command using one of the names specified within this series of **SUPPRESSION** commands for the suppression to be effective.

Note

1. The **SUPPRESSION** command is for text-only fields. It does not work for barcodes or other non-text fields.
2. A maximum of eight suppressions can be specified for one **SUBGROUP** command, and a maximum of 127 suppressions can be specified within one form definition.

Page Definition Command Reference

This section includes:

- Sequence of commands for page definitions
- Page definition commands listed alphabetically
- Detailed information on each command
- Descriptions of the applicable subcommands and parameters for each command

Sequence of Traditional Commands for Page Definitions with PRINTLINE

```
[ SETUNITS, p. 264 ... ]
PAGEDEF, p. 389
[ DEFINE CMRNAME, p. 175 ...]
[ FONT, p. 347 ...]
[ DOFONT, p. 282 ... ]
[ OBJECT, p. 371 ... ]
[ DEFINE COLOR, p. 279 ... ]
[ PAGEFORMAT, p. 399 ]
  [ TRCREf, p. 427 ...]
  [ SEGMENT, p. 425 ...]
  [ RENDER, p. 187 ...]
  [ OVERLAY, p. 387 ...]
  [ EXTREF, p. 307 ... ]
  [ CMR, p. 186 ...]
PRINTLINE, p. 405 [ FIELD, p. 312 | CONDITION, p. 272 ...]
[ ENDSUBPAGE, p. 307 ] |
[ PRINTLINE, p. 405 [ FIELD, p. 312 | CONDITION, p. 272 ...]
[ PAGEFORMAT, p. 399 ]
  [ TRCREf, p. 427 ...]
  [ SEGMENT, p. 425 ...]
  [ OVERLAY, p. 387 ...]
PRINTLINE, p. 405 [ FIELD, p. 312 | CONDITION, p. 272 ...]
[ ENDSUBPAGE, p. 307 ] |
[ PRINTLINE, p. 405 [ FIELD, p. 312 | CONDITION, p. 272 ...] ...]
```

- A **SETUNITS** command can be placed before any other PPFA command. The values set are in effect until the next **SETUNITS** command.
- **FONT** and **DOFONT** commands must be specified immediately after a **PAGEDEF** command and before any other commands, except the **SETUNITS** command.
- **OBJECT** commands must be specified immediately after any **FONT** commands and before any **PAGEFORMAT** or other commands, except the **SETUNITS** command.
- The first **PAGEFORMAT** command can be omitted in a page definition, if the page definition contains only one page format. If the **PAGEFORMAT** command is omitted, the **PAGEDEF** command parameters are used to define the page format.
- **TRCREF**, **SEGMENT**, and **OVERLAY** commands must be specified under their associated **PAGEFORMAT** command.
- At least one **PRINTLINE** command is required per page format for Traditional Line Data Page definition. **PRINTLINE** and **LAYOUT** commands cannot be used within the same page definition.
- An **ENDSUBPAGE** command can occur anywhere in a page definition that a **PRINTLINE** command can occur, except it can not occur between a **PRINTLINE** command and its associated **FIELD** and **CONDITION** commands.
- One file can contain multiple sets of page definitions.

Sequence of Record Formatting Commands for Page Definitions with LAYOUT

```
[ SETUNITS, p. 264 ...]
PAGEDEF, p. 389
FONT, p. 347
[ DOFONT, p. 282 ... ]
[ OBJECT, p. 371 ... ]
[ DEFINE COLOR, p. 279 ... ]
[ PAGEFORMAT, p. 399 ]
  [ SEGMENT, p. 425 ...]
  [ OVERLAY, p. 387 ...]
  [ RENDER, p. 187 ...]
  [ EXTREF, p. 307 ... ]
  [ CMR, p. 186 ...]
  [ LAYOUT, p. 352 ...]
  [ CONDITION, p. 272 ...]
  [ FIELD, p. 312 ...]
  [ DRAWGRAPHIC, p. 287 ...]
  [ ENDGRAPHIC, p. 306 ...]
[ PAGEFORMAT, p. 399 ]
  [ SEGMENT, p. 425 ...]
  [ OVERLAY, p. 387 ...]
  [ LAYOUT, p. 352 ...]
  [ CONDITION, p. 272 ...]
  [ FIELD, p. 312 ...]
  [ DRAWGRAPHIC, p. 287 ...]
  [ ENDGRAPHIC, p. 306 ...]
```

- A **SETUNITS** command can be placed before any other PPFA command. The values set are in effect until the next **SETUNITS** command.
- **LAYOUT**, **XLAYOUT**, and **PRINTLINE** commands cannot be mixed within the same **PAGEDEF**. At least one **LAYOUT** command is required per page format for a record formatting page definition.

- At least one **FONT** or **DOFONT** command is required for each **PAGEDEF** command.
- **FONT** and **DOFONT** commands must be specified immediately after a **PAGEDEF** command.
- The first **PAGEFORMAT** command can be omitted in a page definition, if the page definition contains only one page format. If the **PAGEFORMAT** command is omitted, the **PAGEDEF** command parameters are used to define the page format.
- **SEGMENT**, **OVERLAY** and **EXTREF** commands must be specified under their associated **PAGEFORMAT** command. **EXTREF** must be before the first **LAYOUT** command.
- One file can contain multiple sets of page definitions.

Sequence of Commands for XML Page Definitions with XLAYOUT

```
[ SETUNITS, p. 264 ...]
PAGEDEF, p. 389
FONT, p. 347
[ DOFONT, p. 282 ... ]
[ OBJECT, p. 371 ... ]
[ DEFINE COLOR, p. 279 ... ]
[ DEFINE QTAG, p. 281 ...]
[ PAGEFORMAT, p. 399 ]
  [ SEGMENT, p. 425 ...]
  [ OVERLAY, p. 387 ...]
  [ RENDER, p. 187 ...]
  [ EXTREF, p. 307 ... ]
  [ CMR, p. 186 ...]
  [ XLAYOUT, p. 429 ...]
  [ CONDITION, p. 272 ...]
  [ FIELD, p. 312 ...]
  [ DRAWGRAPHIC, p. 287 ...]
  [ ENDGRAPHIC, p. 306 ...]
[ PAGEFORMAT, p. 399 ]
  [ SEGMENT, p. 425 ...]
  [ OVERLAY, p. 387 ...]
  [ XLAYOUT, p. 429 ...]
  [ CONDITION, p. 272 ...]
  [ FIELD, p. 312 ...]
  [ DRAWGRAPHIC, p. 287 ...]
  [ ENDGRAPHIC, p. 306 ...]
```

- A **SETUNITS** command can be placed before any other PPGA command. The values set are in effect until the next **SETUNITS** command.
- **LAYOUT**, **XLAYOUT**, and **PRINTLINE** commands cannot be mixed within the same **PAGEDEF**. At least one **XLAYOUT** command is required per page format for an XML page definition.
- At least one **FONT** or **DOFONT** command is required for each **PAGEDEF** command.
- **FONT** and **DOFONT** commands must be specified immediately after a **PAGEDEF** command and before the first **PAGEFORMAT** command.
- The first **PAGEFORMAT** command can be omitted in a page definition, if the page definition contains only one page format. If the **PAGEFORMAT** command is omitted, the **PAGEDEF** command parameters are used to define the page format.
- **SEGMENT**, **OVERLAY** and **EXTREF** commands must be specified under their associated **PAGEFORMAT** command. **EXTREF** must be before the first **XLAYOUT** command.

- One file can contain multiple sets of page definitions.

Diagram Shorthand

These terms are used in the command definitions:

x-pos

A vertical position using a numeric number followed optionally by a unit. For the available units, see [Units of Measurement, p. 207](#).

y-pos

A horizontal position using a numeric number followed optionally by a unit. For the available units, see [Units of Measurement, p. 207](#).

3

CONDITION Command

CONDITION Command

```

CONDITION condname
START (Traditional)
START (Record Format and XML)
[WHEN {CHANGE | [{EQ | NE | GT | GE | LT | LE} 'text']}
  {BEFORE | AFTER}
  {SUBPAGE (Traditional) | PAGE (Record Format and XML) | LINE}
  {NEWFORM | NEWSIDE |
  [{CURRENT | =} | FIRST | {NULL | /} | NEXT | COPYGROUP cname}
  [{CURRENT | =} | FIRST | {NULL | /} | NEXT | PAGEFORMAT pfname}}]...
[OTHERWISE
  {BEFORE | AFTER}
  {SUBPAGE (Traditional) | PAGE (Record Format and XML) | LINE}
  {NEWFORM | NEWSIDE |
  [{CURRENT | =} | FIRST | {NULL | /} | NEXT | COPYGROUP cname}
  [{CURRENT | =} | FIRST | {NULL | /} | NEXT | PAGEFORMAT pfname}}] ;

```

START (Traditional)

```
START n LENGTH n [SPACE_THEN_PRINT {YES | NO}]
```

START (Record Format and XML)

```

[{{START n LENGTH n} |
{FLDNUM n [START { 1 | n]} [LENGTH {longest | n}}]

```

Short Form

```
CONDITION condname [START n][FLDNUM n] ;
```

CONDITION

The **CONDITION** command examines data in an input record and specifies actions to be taken based on the result of the examination.

- The *condname* parameter must come before any subcommands.

- No **WHEN** subcommand can follow an **OTHERWISE** subcommand in the same **CONDITION** command.

condname

Names the condition. The name must contain 1 to 8 alphanumeric characters.

PPFA allows cross-referencing to the *condname*. The cross-reference is done by using the short form of the **CONDITION** command. By specifying a previously defined *condname*, PPFA uses the specifications from that command. When the condition is reused, the point where you want the comparison to begin may be at a different point in the record. By specifying the optional **START** subcommand, you can change the starting point of the comparison but not the field length. If the **START** subcommand is not specified, the starting point is the same as defined in the original **CONDITION** command.

↓ Note

When comparing text in fields that contain delimiters, the comparison text must not contain the delimiter. The delimiter is not part of the data.

Subcommands (Long Form)

START Subcommand (Traditional)

```
START n LENGTH n [SPACE_THEN_PRINT {YES | NO}]
```

START Subcommand (Record Format and XML)

```
{{START n LENGTH n} |  
{FLDNUM n [START { 1 | n}] [LENGTH {longest | n}]}
```

Specifies the starting byte of the comparison field within the data record where the comparison is to be done.

n

Specifies the number of bytes from the first data byte in the record as the starting point of the comparison field. The first data byte position of an input record is 1.

↓ Note

The carriage-control character and the table-reference character are not considered data.

LENGTH

Specifies the length of the comparison field.

n

Specifies the number of bytes in the data record to be compared, beginning with the position specified in **START**. Valid values are numbers from 1 to 8000. The length of the constant text must be the same as defined in this parameter or the results are invalid.

Comparisons are done on a byte-by-byte basis. Because the comparison field and the constant text must have the same lengths, padding is not necessary.

↓ **Note**

If any part of the comparison field specified by the combination of **START** and **LENGTH** is outside the boundaries of the data record, no conditional processing is performed. No **WHEN** is executed. If an **OTHERWISE** is present, it is not executed either.

SPACE_THEN_PRINT

Specifies whether ANSI carriage controls for spacing are enabled for the first record on the new logical page following the execution of the **CONDITION** command. The abbreviation of this parameter is **SPACE**.

↓ **Note**

This parameter is effective for print files that contain ANSI carriage controls. It is not used for data files containing machine carriage controls, or a mixture of ANSI and machine carriage controls.

YES

Specifies that the ANSI carriage-control character in the first print record of the new page is enabled for spacing. The spacing action specified in the carriage control is performed after the eject to the new page. For example, if the carriage-control byte in the first record of the new page is a blank (skip one line before printing), then the first record skips the first line of the new page and prints at the second printline position.

NO

Specifies the ANSI carriage-control character spacing action is suppressed for the first print record of the new page. If this record contains a carriage-control spacing value, such as "blank", "0", or "-", the spacing is ignored and the record prints at the first printline position on the new page. Channel code values are not ignored. If the first print record contains a valid channel code value of 1–9, or A–C, then the first record on the new page prints at the printline defined with that channel code.

FLDNUM

```
[START { 1 | n}] [LENGTH {longest | n}]
```

Specifies the field number to be used in comparison. This keyword should only be used if the **DELIMITER** field was used in the **LAYOUT** command. Fields cannot be counted without delimiters being specified in the database.

n

Specifies the number of the field. The first field after the record ID is **FLDNUM 1**.

START

Identifies the position in the numbered field where comparison starts.

LENGTH

Specifies the length of the field to be used in the **WHEN** condition.

longest

The length of the longest condition. When no specific condition is specified, the length from the starting position to the end of the field

WHEN Subcommand

```
{WHEN {CHANGE | [{EQ | NE | GT | GE | LT | LE} 'text']}
```

```
{BEFORE | AFTER}
{SUBPAGE (Traditional) | PAGE (Record Format and XML) | LINE}
{NEWFORM | NEWSIDE
{[CURRENT [=] | FIRST | {NULL | /} | NEXT | COPYGROUP cname}
{[CURRENT [=] | FIRST | {NULL | /} | NEXT | PAGEFORMAT pfname]}]}...
```

Marks the start of the conditional comparison parameters. At least one **WHEN** subcommand is required.

CHANGE

Specifies that the contents of the comparison field in this record are to be compared with the field in the record last processed by the same **CONDITION** command.

This parameter can be specified only once in a **CONDITION** command.

If the comparison field lies outside the boundary of the current record, which may occur with variable-length records or with truncated trailing blanks, the current record is not used in future comparisons

The results of the comparison is either **TRUE** or **FALSE**:

TRUE

The contents of the comparison field have changed from one record to the next.

FALSE

The contents of the comparison field have changed from one record to the next.

CHANGE is always false if used with the first **WHEN** subcommand of a series (no previous record to compare against). Whenever a new data map (one with a different name) is invoked, all the **CHANGE** comparisons are reset. Field values in the previous data map are not retained.

```
{ EQ | NE | GT | GE | LT | LE }
```

Specifies the type of comparison that is to be performed between the data in the comparison field (the portion of the record specified by **START** and **LENGTH**) and the constant text defined in the *text* parameter.

The choices are:

EQ

Equal to

NE

Not equal to

GT

Greater than

GE

Greater than or equal to

LT

Less than

LE

Less than or equal to

text

Specifies constant text for comparison with the comparison field text. The constant text length must be the same as the value on the **LENGTH** subcommand, with a maximum length of 8000 bytes. Examples of valid text are:

```
2C(3)'AB'
K'321,400'
X'41FE7799' 2 'CHARS'
```

Any values or parameters that are valid for the **TEXT** subcommand within the **FIELD** command may be used as text.

BEFORE

Specifies that the conditional action takes place before the current line or subpage is processed. This is the default.

AFTER

Specifies that the conditional action takes place after the current line or subpage is processed.

SUBPAGE (Traditional)

Specifies that the conditional action takes place either before or after the current subpage. This is the default for traditional page definitions.

For a description of subpages, see [Logical Page, p. 15](#).

Note

For **CONDITION** commands in a record format or XML page definition, the keyword **SUBPAGE** is acceptable but obsolete. Record format and XML page definitions do not have subpages.

PAGE (Record Format and XML)

Specifies that the conditional action takes place either before or after the current page. This is the default for record format and XML page definitions.

LINE

Specifies that the conditional action takes place either before or after the current line.

NEWFORM

Specifies that the only action to be taken is skipping to the front of a new form (sheet) and restarting the page format.

Note

This parameter is an alternative to using the *copygroup* and *pageformat* parameters, and is equivalent to specifying **CURRENT** for the *copygroup* parameter and **NULL** for the *pageformat* parameter. **CURRENT** and **NULL** are the respective defaults for *copygroup* and *pageformat* parameters; therefore, **NEWFORM** is the default action.

NEWSIDE

Specifies that the only action to be taken is skipping to a new side (either the back of the current sheet or the front of a new sheet) and restarting the page format.

↓ **Note**

1. This parameter is an alternative to using the *copygroup* and *pageformat* parameters, and is equivalent to specifying **NULL** for the *copygroup* parameter and **CURRENT** for the *pageformat* parameter.
2. Conditional processing does not result in unnecessary blank pages.

If the line currently being processed is the first line on a side, then:

- A **COPYGROUP** or **NEWFORM** action taking effect **BEFORE LINE** does not force an additional new form.
- A **PAGEFORMAT** or **NEWSIDE** action taking effect **BEFORE LINE** does not force an additional new side.

Similarly, additional sides or forms are not forced by **BEFORE SUBPAGE** if the line currently being processed is in the first subpage on a side or a form.

copygroup

Specifies a copy group to be invoked if the condition is true.

↓ **Note**

Any copy group action (except **NULL**) restarts the page format.

CURRENT or =

Invoke the current copy group again. This ends printing on the current sheet and resumes it on the front side of a new sheet.

The page format is restarted. This means that the first input record to go on the new page is printed using the first **PRINTLINE** command of the current page format, and so on. For example, data that was to be printed as subpage 4 on the sheet might be printed on subpage 1 on the new sheet.

FIRST

Invokes the first copy group in the current form definition.

NULL or /

Retains the current copy group, taking no action.

NEXT

Invokes the next copy group in the current form definition.

↓ **Note**

If **NEXT** is specified from the last copy group in the form definition, the first copy group in the form definition is used.

COPYGROUP *cgname*

Uses the named copy group defined in the current form definition. The name must contain 1 to 8 alphanumeric characters.

pageformat

Specifies a page format to be invoked if the condition is true.

CURRENT or =

Invokes the current page format again. This results in ending printing on the current sheet and resuming on the front side of a new sheet.

The page format is restarted. This means that the first input record to go on the new page is printed using the first **PRINTLINE** command of the current page format, and so on.

FIRST

Invokes the first page format in the current page definition.

NULL or /

Retains the current page format, taking no action.

NEXT

Invokes the next page format in the current page definition.

 **Note**

If **NEXT** is specified from the last page format in the page definition, the first page format in the page definition is used.

PAGEFORMAT *pfname*

Uses the named page format defined in the current page definition. The name must contain 1 to 8 alphanumeric characters.

OTHERWISE Subcommand

```
OTHERWISE
{BEFORE | AFTER}
{SUBPAGE (Traditional) | PAGE (Record Format and XML) | LINE}
{NEWFORM | NEWSIDE |
{[CURRENT | =] | FIRST | {NULL | /} | NEXT | COPYGROUP cgname}
{[CURRENT | =] | FIRST | {NULL | /} | NEXT | PAGEFORMAT pfname}}
```

Marks the start of a conditional action to be taken if all preceding **WHEN** comparisons have proved false. The syntax is the same as the **WHEN**, subcommand, except that the comparison parameters (*comparisontype text* or **CHANGE**) are not used. See the **WHEN** parameters starting with **BEFORE**, for a description of the parameters.

If the **OTHERWISE** subcommand is not used within the sequence, no action is taken. This is the same as if an **OTHERWISE NULL NULL** had been entered.

 **Note**

OTHERWISE is not executed if any part of the comparison field specified by the combination of **START** and **LENGTH** is outside the boundaries of the data record.

Subcommands (Short Form)

```
CONDITION condname [START n][FLDNUM n] ;
```

Note

No other parameters can be specified on the short form of the **CONDITION** command. They are inherited from the associated long form.

condname

Specifies the name of the condition. This value cross-references the short form of the **CONDITION** command to the long form of the **CONDITION** command for the same condition

START *n*

Use this parameter to specify a new starting position for the text to be tested. If this parameter is coded, it overrides the value that is specified or defaulted in the long form of this **CONDITION** command.

FLDNUM *n*

Use this parameter to specify a new field number for the text to be tested. **FLDNUM** can only be specified if the **LAYOUT** or **XLAYOUT** is coded with a delimiter. If this parameter is coded, it overrides the value that is specified or defaulted in the long form of this **CONDITION** command.

Note

No other parameters can be specified on the short form of the **CONDITION** command. They are inherited from the associated long form.

DEFINE COLOR Command

DEFINE COLOR Command

```
DEFINE colorname
COLOR {OCA ocacolor |
RGB rvalue gvalue bvalue |
CMYK cvalue mvalue yvalue kvalue |
HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
CIELAB lvalue [(-)] c1value [(-)] c2value ;
```

DEFINE COLOR

Defines a color name of a particular color model such as **OCA**, **RGB**, **CMYK**, **HIGHLIGHT**, or **CIELAB**. This name can be used anywhere that color of that model is allowed. For example a defined color of any color model can be used as text color in the **FIELD** or **PRINTLINE** commands, but only a color defined as an **OCA** color can be used as an object placement area color. See the **OBCOLOR** subcommand in [PRINTLINE Command \(Traditional\)](#), p. 405.

colorname

Select a 1 to 10 character name. Use this name on the command to identify this color. For example:

```
DEFINE o1dblue COLOR OCA brown;
PRINTLINE COLOR o1dblue;
```

Subcommands

COLOR Subcommand

```
COLOR {OCA ocacolor |
RGB rvalue gvalue bvalue |
CMYK cvalue mvalue yvalue kvalue |
HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
CIELAB lvalue [(-)] c1value [(-)] c2value}
```

Specifies the color of print for this field supported in MO:DCA for the **OCA**, the Red/Green/Blue color model (**RGB**), the highlight color space, the Cyan/Magenta/Yellow/Black color model (**CMYK**), and the **CIELAB** color model.

OCA *ocacolor*

Chose one of the standard **OCA** colors or synonyms:

- **BLUE**
- **RED**
- **MAGENTA** (or **PINK**)
- **GREEN**
- **CYAN** (or **TURQ**)
- **YELLOW**
- **BLACK**
- **BROWN**
- **MUSTARD**
- **DARKBLUE** (or **DBLUE**)
- **DARKGREEN** (or **DGREEN**)
- **DARKTURQ** (**DTURQ**, or **DCYAN**, or **DARKCYAN**)
- **ORANGE**
- **PURPLE**
- **GRAY**
- **NONE**
- **DEFAULT**

↓ Note

In some printer publications, the color turquoise (**TURQ**) is called "cyan", and the color pink (**PINK**) is called "magenta".

RGB *rvalue gvalue bvalue*

Three **RGB** integer values are used. The first (*rvalue*) represents a value for red, the second (*gvalue*) represents a value for green, and the third (*bvalue*) represents a value for blue. Each of the three integer values may be specified as a percentage from 0 to 100.

↓ Note

An **RGB** specification of 0/0/0 is black. An **RGB** specification of 100/100/100 is white. Any other value is a color somewhere between black and white, depending on the output device.

HIGHLIGHT *hvalue* [**COVERAGE** *cvalue*] [**BLACK** *bvalue*]

Indicates the highlight color model. Highlight colors are device dependent.

You can use an integer within the range of 0 to 65,535 for the *hvalue*.

↓ **Note**

An *hvalue* of 0 indicates that there is no default value defined; therefore, the default color of the presentation device is used.

COVERAGE indicates the amount of coverage of the highlight color to be used. You can use an integer within the range of 0 to 100 for the *cvalue*. If less than 100 percent is specified, the remaining coverage is achieved with the color of the medium.

↓ **Note**

Fractional values are ignored. If **COVERAGE** is not specified, a value of 100 is used as a default.

BLACK indicates the percentage of black to be added to the highlight color. You can use an integer within the range of 0 to 100 for the *bvalue*. The amount of black shading applied depends on the **COVERAGE** percentage, which is applied first. If less than 100 percent is specified, the remaining coverage is achieved with black.

↓ **Note**

If **BLACK** is not specified, a value of 0 is used as a default.

CMYK *cvalue mvalue yvalue kvalue*

Defines the cyan/magenta/yellow/black color model. *cvalue* specifies the cyan value. *mvalue* specifies the magenta value. *yvalue* specifies the yellow value. *kvalue* specifies the black value. You can use an integer percentage within the range of 0 to 100 for any of the **CMYK** values.

CIELAB *Lvalue (-)c1value (-)c2value*

Defines the **CIELAB** model. Use a range of 0.00 to 100.00 with *Lvalue* to specify the luminance value. Use signed integers from -127 to 127 with *c1value* and *c2value* to specify the chrominance differences.

Lvalue, *c1value*, *c2value* must be specified in this order. There are no defaults for the subvalues.

↓ **Note**

Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **FIELD** or **PRINTLINE** command. The output is device dependent and may not be what you expect.

DEFINE QTAG Command (XML)

```
DEFINE qtagname QTAG starttag[,starttag]... ;
```

DEFINE QTAG

Defines a local identifier for a qualified tag which can be used later in the page definition on a **XLAYOUT** command. A **QTAG** is a sequence of one or more start-tag names which taken together identify an XML data element. This is the logical equivalent of the “record Identifier” on the **LAYOUT** command for a record formatting page definition. But, instead of identifying an entire record as the **LAYOUT** command does, the **QTAG** identifies a single XML data element.

When used, the local identifier makes the coding of an **XLAYOUT** command easier by allowing the use of a locally defined name instead of the fully-qualified set of start tags. It also makes the **XLAYOUT** command syntax similar to the **LAYOUT** command.

qtagname

The internal name assigned to the fully-qualified **QTAG**. This name can be used on the **XLAYOUT** command to identify the XML data item. This name is not case sensitive. It can be up to 16 characters in length.

starttag

An XML element name. This name must match exactly to the element name in the XML data. To preserve the case for the name, put it in quotes. Otherwise, the name is folded to upper case. Separate multiple *starttag* values with commas.

If necessary, the name is translated to the datatype specified or defaulted by the **UDTYPE** subcommand on the **PAGEDEF** command. For example, if the page definition is coded on an EBCDIC platform, but the **UDTYPE** specifies UTF8, PPFA converts the start tags from EBCDIC code page 500 to UTF-8.

See the [XLAYOUT Command \(XML\)](#), p. 429 for an example of using a defined **QTAG** with an **XLAYOUT** command.

DOFONT Command

The **DOFONT** command defines a Data Object font and specifies its attributes. Data Object fonts include TrueType and OpenType fonts. A “Font Installer” is used to install Data Object fonts and a Resource Access Table (RAT). The RAT contains a table which, when accessed with the full font name provided by the user, gives the file access name for the font. All names in the RAT are encoded in UTF-16. For more information see *How To Use TrueType and OpenType Fonts in an AFP System*, G544-5876.

Data Object Font Support

To use Data Object fonts, do the following:

- Non-PPFA requirements:
 - You must have a printer and a print server (PSF or IPM) that supports Data Object fonts.
 - You must have installed a Resource Access Table (RAT) and the Data Object fonts being used. For more information, see *How To Use TrueType and OpenType Fonts in an AFP System*, G544-5876.
- PPFA requirements:
 - Define the font using a **DOFONT** command.
 - Reference the font in one of the following two ways:

- ◆ Reference the font with the **PRINTLINE**, **LAYOUT**, **XLAYOUT**, **FIELD**, or **FIELD BARCODE** commands using the local name.
- ◆ Use the **EXTREF** command in the appropriate **PAGEFORMAT** to create an “external” reference to any font that must be mapped but is not referenced in the above manner. For example, a BCOCA object could be presented in the page definition and that object could use a font not referenced by the page definition. The **EXTREF** command would allow the font to be mapped.

Syntax

```
DOFONT lname {'tffname' | X'16'uuuuuuuu...'}
[HEIGHT 10 POINTS | HEIGHT n [POINTS | IN | CM | MM | PELS]]
[RATIO percent]
[ROTATION [0 | 90 | 180 | 270]]
[PRELOAD]
[UDType of the PAGEDEF |
UDType {EBCDIC [CP {'T1V10500' | code-page-name]} |
EBCDIC2 CP code-page-name |
ASCII [CP {'T1000819' | code-page-name]}
UTF8 | UTF16]]
[MICR]
[INLINE] ;
```

DOFONT

Defines a Data Object Font.

lname

Specifies the local name for the font. This is an unquoted alphanumeric name of 1 to 16 characters. The name must be unique within this page definition. *lname* is the name used in the **EXTREF**, **PRINTLINE**, **LAYOUT**, **XLAYOUT**, **FIELD**, or **FIELD BARCODE** commands using **FONT** or **DOFONT** commands which reference the font.

'*tffname*' or X'16'*uuuuuuuu...*'

The full font name of the Data Object font, for example “Times New Roman Bold”.

'*tffname*'

Specifies a quoted, case sensitive name of the Data Object font to be used in this page definition. Names entered in this form are translated to UTF-16 for matching in the RAT. The name can be 1 to 125 characters long and can contain blanks. It is entered in the platform encoding (for example, ASCII or EBCDIC). The full font name is case sensitive and must match exactly the full font name in the Data Object font, including blanks. Long font names should be entered as follows:

```
DOFONT Font1 'A very long named Helvetica Font whose '
              'name will not fit on one line, and '
              'maybe not even on two lines'
              Height 12 points;
```

Be sure the blanks are not left out and the case (Upper or Lower) of the characters are correct.

X'16'*uuuuuuuu...*'

The full font name of the Data Object font in Unicode UTF-16BE (Big Endian) encoding. Enter the full Unicode font name in hex digits. Four hex digits represent

one Unicode code point if it isn't a surrogate. It takes eight if it is a surrogate. PPFA only checks that the entered digits are a multiple of four. The total number of hex digits entered is restricted to 500. This allows a font name of up to 125 characters (if there are no surrogates). No translation is done on the name when entered in this format. The Unicode UTF-16BE is case sensitive and must match exactly the full font name in the Data Object font, including blanks. Long font names should be entered as follows:

```
DOFONT Font1 X16'0041002000760065007200790020006C'
              '006F006E006700200066006F006E0074'
              '0020006E0061006D0065006400200048'
              '0065006C007600650074006900630061'
              Height 12 points;
```

Be sure the blanks are included and the case (upper or lower) of the characters are correctly encoded.

3

Subcommands

HEIGHT Subcommand

```
HEIGHT 10 POINTS | HEIGHT n [POINTS | IN | CM | MM | PELS]
```

Specifies the height of a Data Object font.

n

A number specifying the height of the Data Object font. This number can be up to 3 decimal places.

Note

If **HEIGHT** is not specified the default is 10 points.

units

One of the following standard units:

POINTS

Each point is equivalent to 1/72 of an inch (default)

IN

Inches

CM

Centimeters

MM

Millimeters

PELS

Pels in the current Logical Units per inch; for example, in 240ths of an inch

RATIO Subcommand

```
RATIO percent
```

Specifies the ratio of scaling the width relative to the height in a font.

percent

Represents the percent of the “normal” width of the character that is printed. For example, **RATIO 50** yields a font with characters half as wide as normal.

ROTATION Subcommand

```
[ROTATION [0 | 90 | 180 | 270]]
```

Specifies the rotation of characters in degrees. The specified value is relative to the inline direction of the line to be printed. Valid rotations are **0**, **90**, **180**, and **270**. Zero is the default.

PRELOAD Subcommand

```
PRELOAD
```

To preload the font before starting the print job, specify this subcommand. Preloaded fonts enhance print performance. The printer must support this function.

UDType Subcommand

```
[UDType of the PAGEDEF |  
UDType {EBCDIC [CP {'T1V10500' | code-page-name}] |  
EBCDIC2 CP code-page-name |  
ASCII [CP {'T1000819' | code-page-name}]  
UTF8 | UTF16}]
```

The **UDType** subcommand specifies the user's data type and, optionally, the code page name for mapping the font.

If **UDType** is not coded on the **DOFONT** command it defaults to the coded or default **UDType** of the page definition.

↓ Note

1. Using a code page with a **UDType** specifies the code page used by the application to create the data.
2. To use multiple font mappings for a line in **ASCII**, **UTF8**, or **UTF16** you must use the **FIELD** command, since automatic font switching for single and double byte text is only done for EBCDIC data.

EBCDIC

Single byte EBCDIC.

CP

Code Page name. This parameter is optional here and, if not coded, the default is single byte EBCDIC code page “T1V10500”.

code-page-name

Enter a quoted or unquoted string for the code page name. If the string is unquoted it can be up to 6 characters. The string will be folded to upper case and the two-character prefix “T1” is added. If the string is quoted, it can be up to 8 characters, will retain the case, and no prefix is added.

EBCDIC2

Double byte EBCDIC.

CP

Code Page name. This parameter is mandatory.

code-page-name

Enter a quoted or unquoted string for the code page name. If the string is unquoted it can be up to 6 characters. The string is folded to upper case and the two character prefix "T1" is added. If the string is quoted it can be up to 8 characters, will retain the case, and no prefix is added.

ASCII

Single byte ASCII.

CP

Code Page name. This parameter is optional here and, if not coded, the default is single byte ASCII code page "T1000819".

code-page-name

Enter a quoted or unquoted string for the code page name. If the string is unquoted, it can be up to 6 characters. The string is folded to upper case and the two character prefix "T1" is added. If the string is quoted, it can be up to 8 characters, will retain the case, and no prefix is added.

UTF8

Unicode encoding form UTF-8.

UTF16

Unicode encoding form UTF-16.

MICR Subcommand

MICR

Specifies that this font is to be used for MICR print. MICR print defines that the font is to be used for Magnetic Ink Character Recognition (MICR) printing. When MICR printing is requested, the font needs to be designed for use in MICR applications. MICR text is normally printed using a toner that is mixed with a magnetic material.

INLINE Subcommand

INLINE

Specifies that this font resource is to be found in an inline resource group when processing the line data and no additional resource libraries are to be searched. Its use is intended to correspond to a data object font resource used with complex text contained in a PTOCA text object. This PTOCA text object is included using the **OBJECT** command in PPFA.

Complex text languages provide different layouts for the presentation of text and its storage. Bi-directional (BIDI) languages present text normally from right to left; however, some text such as numbers and embedded Latin, Cyrillic and Greek scripts, are written from left to right. These BIDI languages include Arabic, Urdu, Farsi and Hebrew.

It is strongly recommended that all TrueType/OpenType fonts that are used for complex text rendering be placed in the print file resource group (inline). To ensure that only a font from the print file resource group is used by the presentation system, it is strongly recommended that the **INLINE**

parameter be used for such fonts. The user is responsible for including the font in an inline printfile resource group.

Data Object Font Examples

In the page definition below there are several examples of font coding:

- There are 2 AFP fonts defined, *myfont* and *font1*.
- There are 4 Data Object fonts defined, *fontU*, *font2*, *font3*, and *font4*.
 - *fontU* is not referenced in the page definition, but is specified as referenced externally, because it is used in the GOCA object *AmFlag*.
 - Fonts *myfont*, *font1*, *font2*, *font3*, and *font4* are referenced normally on a **PRINTLINE** command.
 - *font2* uses the **UDTYPE** subcommand with a named code page.
 - *font3* specifies a height and is “preloaded”.
 - *font4* has its name specified in Unicode UTF-16BE. **(Traditional only)**
 - *font4* has its name specified in Unicode UTF-16. **(Record Format and XML only)**

BLTR2 | TLBR1 | TLBR2] [COLOR colorname]]...
[RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}]
[CMR cmr1name {AUDIT | INSTR | LINK}]... ;
```

The **DRAWGRAPHIC BOX** command allows you to generate GOCA objects in order to draw boxes on the page.

Note

GOCA boxes require specific microcode in your printer.

This command allows you to draw a box of varying attributes and colors at either the current line position or a specified position. **DRAWGRAPHIC** can be used with the **COLOR** parameter and **DEFINE COLOR** to shade a box with a percentage of black or other colors.

Subcommands

GRAPHID Subcommand

```
GRAPHID {00 | nn}
```

Specifies a number that is used later to identify as the box or set of boxes to be closed by the **ENDGRAPHIC** command. The default is **00**.

POSITION Subcommand

```
POSITION LPOS [[(+)] | (-)] horiz {IN | MM | CM | POINTS | PELS}]
NEXT [[LPOS | CPOS] [(+)] | (-)] vert {IN | MM | CM | POINTS | PELS}]
```

Specifies the horizontal and vertical position for the first box. This position is relative to the **LAYOUT** command's position statement or the current position.

SpelPOS specifies the layout position. If **LPOS** is used alone, the position is the same position as is specified on the **LAYOUT** command. If it is used with a **+** or **-** value, the position moves that amount from the **LAYOUT** position.

CPOS

Specifies the current position. If **CPOS** is used alone, the position is the same position as is specified on the previous **FIELD** or **DRAWGRAPHIC** command. If it is used with a **+** or **-** value, the position moves that amount from the **FIELD** or **DRAWGRAPHIC** command position.

BOXSIZE Subcommand

```
BOXSIZE width [IN | MM | CM | POINTS | PELS]
      [height [IN | MM | CM | POINTS | PELS]]
```

Specifies the horizontal and, optionally, vertical dimensions of the box. The first parameter is required and specifies the horizontal width of the box, which is a fixed size. The second parameter is optional and if given, specifies the fixed vertical depth of the box. If the second parameter is omitted, the box is a variable size or "floating" box. For a floating box, the depth of the box is determined when the box is closed with an **ENDGRAPHIC** command.

ROUNDED Subcommand

ROUNDED { **MEDIUM** | **SMALL** | **LARGE** | **MAX** }

Specifies the size of the rounded corner:

MEDIUM

Medium corner length: equates to a radius of 20 pels at 240 pels/inch or 120 pels at 1440 pels/inch

SMALL

Small corner length:- equates to a radius of 10 pels at 240 pels/inch or 60 pels at 1440 pels/inch.

LARGE

Large corner length: equates to a radius of 30 pels at 240 pels/inch or 180 pels at 1440 pels/inch

MAX

Maximum corner length gives an arc with a radius that extends half the length of the shortest box side. If boxes are rounded **MAX**, they cannot be open-ended.

LINEWT Subcommand

LINEWT [**MEDIUM** | **LIGHT** | **BOLD** | *n*]

Specifies the weight of the line either as one of the following keywords or in linewidths (1 linewidth = .01 inch). Specify 0 if you want invisible borders (type and color are then ignored).

LIGHT

The same as **LINEWT 1** (.01 inch)

MEDIUM

The same as **LINEWT 2** (0.2 inch)

BOLD

the same as **LINEWT 3** (.03 inch)

LINETYPE Subcommand

LINETYPE [**SOLID** | **DOTTED** | **SHORTDASH** | **DASHDOT** | **DBLDOT** | **LONGDASH** | **DSHDBLDOT**] [**COLOR** *colorname*]

Specifies the line type using one of these keywords:

SOLID

DOTTED

SHORTDASH

DASHDOT

DBLDOT (double dot)**LONG**DASH**DSH**DBLDOT (dash double dot)**COLOR***colorname*

Specifies the color to be used for the box border. The color name must be either one of the pre-defined **OCA** keywords or the color name from the **DEFINE COLOR** command.

COPY Subcommand

```
COPY [ACROSS | DOWN] n [SPACED [0 | n] [IN | MM | CM | POINTS | PELS]
```

Specifies that the box repeats at regular intervals either across or down the page. The total number of boxes is one more than the value specified on this parameter.

Note

If boxes are repeated in the **DOWN** direction, they cannot be open-ended.

Spaced Boxes (not to scale).**Boxes Spaced 0 (not to scale).****SPACED**

Specifies the spacing between the boxes. The default is to have no space between the boxes. If there is no space between the boxes, the common border is shared and not duplicated.

FILL Subcommand

```
[FILL [ALL | BOX n] [SOLID | NOFILL | DOT01 | DOT02 | DOT03 |
DOT04 | DOT05 | DOT06 | DOT07 | DOT08 | VERTLN | HORZLN | BLTR1 |
BLTR2 | TLBR1 | TLBR2] [COLOR colorname]]...
```

Specifies that a box is to be filled with a pre-defined **GOCA** pattern and optionally specifies a fill color.

If more than one **FILL** subcommand applies to a box, the last **FILL** wins.

ALL

Fill all boxes. This is the default.

BOX *n*

Specifies the box to be filled. Boxes are numbered in the order that they are defined by the **COPY** parameter, starting with 1.

SOLID | **NOFILL** | **DOT01** | **DOT02** | **DOT03** | **DOT04** | **DOT05** | **DOT06** | **DOT07** | **DOT08** | **VERTLN** | **HORZLN** | **BLTR1** | **BLTR2** | **TLBR1** | **TLBR2**

Specifies the fill pattern to use. For an example of the various GOCA-supported fill patterns, see [Fill Patterns for DRAWGRAPHIC Commands](#), p. 479.

NOFILL

The **NOFILL** keyword can be used when a series of boxes has been specified as filled and one or more of them are to be left empty. In the example, boxes 1, 2, 4, and 5 are filled with solid blue and box 3 is empty:

```
LAYOUT ...
Drawgraphic BOX boxsize 1 in .2 in copy down 4
Linetype solid color green
FILL ALL SOLID Color Blue
FILL Box 3 NOFILL;
```

3

RENDER Subcommand

RENDER {**PERCEPTUAL** | **SATURATION** | **RELCM** | **ABSCM**}

Specifies the rendering intent (RI) for a defined graphic (GOCA) object within a page definition. RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC).

Note

1. See [AFP Color Management](#), p. 164 for more information about using the **RENDER** subcommand.
2. See the current level of the ICC Specification for more information on RI.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore

colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

CMR Subcommand

```
[CMR cmr1name {AUDIT | INSTR | LINK}]...
```

Specifies a Color management resource (CMR) and its process mode for a graphics object within the page definition.

↓ Note

See [AFP Color Management, p. 164](#) for more information about using the **CMR** subcommand.

cmr1name

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

↓ Note

This parameter must immediately follow the **CMR** keyword.

Processing mode parameter

Specify the processing mode for the CMR.

AUDIT

Process this CMR as an audit CMR.

INSTR

Process this CMR as an instruction CMR.

LINK

Process this CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs.

Code Example: The following examples show how to define CMRs and rendering intent for graphics objects. Rendering intent and a CMR are defined for Record Format and XML page definitions. These are the only two page definition types for which **DRAWGRAPHIC** commands are legal.

```
DEFINE mycmr CMRNAME ... ;

PAGEDEF cmr11L REPLACE yes;
  FONT f1;
  LAYOUT 'L1';
  DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
    RENDER relcm CMR myCMR audit;

PAGEDEF cmr11X REPLACE yes;
  FONT f1 TYPE ebcDic;
```

```
XLAYOUT QTAG 'x1';
DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
RENDER relcm CMR myCMR audit;
```

DRAWGRAPHIC LINE Command (Record Format and XML)

```
DRAWGRAPHIC LNE [GRAPHID {00 | nn}]
[POSITION LPOS [[(+)|(-)] horiz {IN | MM | CM | POINTS | PELS}]
NEXT [[LPOS | CPOS] [(+)|(-)] vert {IN | MM | CM | POINTS | PELS}]
[ACROSS length {IN | MM | CM | POINTS | PELS}]
[DOWN length {IN | MM | CM | POINTS | PELS}]
TO [(-)] horiz {IN | MM | CM | POINTS | PELS}
[(-)] vert {IN | MM | CM | POINTS | PELS}
[LINewT [MEDIUM | LIGHT | BOLD | n]]
[LINETYPE [SOLID | DOTTED | SHORTDASH | DASHDOT | DBL DOT | LONGDASH |
DSHDBL DOT] [COLOR colorname]]
[COPI {ACROSS | DOWN} n [SPACED n {IN | MM | CM | POINTS | PELS}]]
[RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}]
[CMR cmrname {AUDIT | INSTR | LINK}]... ;
```

The **DRAWGRAPHIC LINE** command allows you to use GOCA (Graphic Character Global Identifier) objects in order to draw lines on the page. This command allows you to create either one straight line or a series of straight lines from either the current line position or a specified position.

Note

GOCA lines require specific microcode in your printer.

Subcommands

GRAPHID Subcommand

```
GRAPHID {00 | nn}
```

Specifies a number that is used later to identify as the line or set of lines to be closed by the **ENDGRAPHIC** command. The default is **00**.

POSITION Subcommand

```
POSITION LPOS [[(+)|(-)] horiz {IN | MM | CM | POINTS | PELS}]
NEXT [[LPOS | CPOS] [(+)|(-)] vert {IN | MM | CM | POINTS | PELS}]
```

Specifies the horizontal and vertical position for the start of the first line. This position is relative to the **LAYOUT** command's position statement or the current position.

LPOS

Specifies the layout position. If **LPOS** is used alone, the position is the same position as is specified on the **LAYOUT** command. If it is used with a **+** or **-** value, the position moves that amount from the **LAYOUT** position.

CPOS

Specifies the current position. If **CPOS** is used alone, the position is the same position as is specified on the previous **FIELD** or **DRAWGRAPHIC** command command. If it is used with

a + or - value, the position moves that amount from the **FIELD** or **DRAWGRAPHIC** command position.

ACROSS or DOWN or TO Subcommand

```
{ACROSS length [IN | MM | CM | POINTS | PEL]
DOWN length [IN | MM | CM | POINTS | PELS]
TO [(-)] horiz [IN | MM | CM | POINTS | PELS]
[(-)] vert [IN | MM | CM | POINTS | PELS]}
```

Specifies the line length.

ACROSS

Specifies the line length in the **ACROSS** (horizontal) direction. If **ACROSS** is specified, the line length must also be specified.

DOWN

Specify the line length in the **DOWN** (vertical) direction. If **DOWN** is specified and the *n units* value is not entered, the line continues until either a logical page eject is executed or an **ENDGRAPHIC** is found.

TO

Specifies horizontal and vertical ending positions for a point-to-point line. The **TO** position is specified relative to the **POSITION** parameter values in this command.

LINEWT Subcommand

```
LINEWT [MEDIUM | LIGHT | BOLD | n]
```

Specifies the weight of the line either as one of the following keywords or in linewidths (1 linewidth = .01 inch). Specify 0 if you want invisible borders (type and color are then ignored).

LIGHT

The same as **LINEWT 1** (.01 inch)

MEDIUM

The same as **LINEWT 2** (0.2 inch)

BOLD

the same as **LINEWT 3** (.03 inch)

LINETYPE Subcommand

```
LINETYPE [SOLID | DOTTED | SHORTDASH | DASHDOT | DBLDOT | LONGDASH |
DSHDBLDOT] [COLOR colorname]
```

Specifies the line type using one of these keywords:

SOLID

DOTTED

SHORTDASH

DASHDOT

DBLDOT (double dot)

LONGDASH

DSHDBLDOT (dash double dot)

COLOR*colorname*

Specifies the color to be used for the line. The color name must be either one of the pre-defined **OCA** keywords or the color name from the **DEFINE COLOR** command.

COPY Subcommand

```
COPY {ACROSS | DOWN} n [SPACED n [IN | MM | CM | POINTS | PELS]
```

Repeats the same line at regular intervals either across or down the page. The total number of lines is one more than the value specified on this parameter.

SPACED

Specifies the spacing between the lines.

RENDER Subcommand

```
RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}
```

Specifies the rendering intent (RI) for a defined graphic (GOCA) object within a page definition. RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC).

 **Note**

1. See [AFP Color Management, p. 164](#) for more information about using the **RENDER** subcommand.
2. See the current level of the ICC Specification for more information on RI.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

CMR Subcommand

```
[CMR cmr1name {AUDIT | INSTR | LINK}]...
```

Specifies a color management resource (CMR) and its process mode for a graphics object within the page definition.

Note

See [AFP Color Management, p. 164](#) for more information about using the **CMR** subcommand.

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

Note

This parameter must immediately follow the **CMR** keyword.

Processing mode parameter

Specify the processing mode for the CMR.

AUDIT

Process this CMR as an audit CMR.

INSTR

Process this CMR as an instruction CMR.

LINK

Process this CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs.

Code Example: The following examples show how to define CMRs and rendering intent for graphics objects. Rendering intent and a CMR are defined for Record Format and XML page definitions. These are the only two page definition types for which **DRAWGRAPHIC** commands are legal.

```
DEFINE mycmr CMRNAME ... ;

PAGEDEF cmr11L REPLACE yes;
  FONT f1;
  LAYOUT 'L1';
  DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
  RENDER relcm CMR myCMR audit;

PAGEDEF cmr11X REPLACE yes;
  FONT f1 TYPE ebcdic;
  XLAYOUT QTAG 'x1';
  DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
  RENDER relcm CMR myCMR audit;
```

DRAWGRAPHIC CIRCLE Command (Record Format and XML)

```
DRAWGRAPHIC CIRCLE
[POSITION LPOS [[(+)] | (-)] horiz {IN | MM | CM | POINTS | PELS}]
NEXT [[LPOS | CPOS] [(+)] | (-)] vert {IN | MM | CM | POINTS | PELS}]
RADIUS n [IN | MM | CM | POINTS | PELS]
[LINewT [MEDIUM | LIGHT | BOLD | n]]
[LINeTYpe [SOLID | DOTTED | SHORTDASH | DASHDOT | DBLDOt | LONGDASH |
```

```

        DSHDBLDOT] [COLOR colorname]
[ COPY {ACROSS | DOWN} n
[ SPACED {DIAMETER | n [IN | MM | CM | POINTS | PELS]]]
[ FILL [ALL | CIRCLE n]
[ SOLID | NOFILL | DOT01 | DOT02 | DOT03 |
DOT04 | DOT05 | DOT06 | DOT07 | DOT08 | VERTLN | HORZLN |
BLTR1 | BLTR2 | TLBR1 | TLBR2] [COLOR colorname]...
[ RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}]
[ CMR cmr1name {AUDIT | INSTR | LINK}]... ;

```

The **DRAWGRAPHIC CIRCLE** command allows you to generate GOCA (Graphics Object Content Architecture) objects in order to draw circles on the page. You can create a circle at either a specified radial distance from the last line printed or a specified position.

Note

GOCA circles require specific microcode in your printer.

DRAWGRAPHIC CIRCLE can be used with the **COLOR** parameter and **DEFINE COLOR** to shade a circle with a percentage of black or other colors.

Subcommands

POSITION Subcommand

```

POSITION LPOS [[(+)] | (-)] horiz {IN | MM | CM | POINTS | PELS}
NEXT [[LPOS | CPOS] [(+)] | (-)] vert {IN | MM | CM | POINTS | PELS}

```

Specifies the horizontal and vertical position of the center of the first circle. This position is relative to the **LAYOUT** command's position statement or the current position.

LPOS

Specifies the layout position. If **LPOS** is used alone, the position is the same position as is specified on the **LAYOUT** command. If it is used with a **+** or **-** value, the position moves that amount from the **LAYOUT** position.

CPOS

Specifies the current position. If **CPOS** is used alone, the position is the same position as is specified on the previous **FIELD** or **DRAWGRAPHIC** command command. If it is used with a **+** or **-** value, the position moves that amount from the **FIELD** or **DRAWGRAPHIC** command position.

RADIUS Subcommand

```

RADIUS n [IN | MM | CM | POINTS | PELS]

```

Specifies the circle radius. (The radius is measured from the center of the circle to the middle of the line width.)

LINEWT Subcommand

```

LINEWT [MEDIUM | LIGHT | BOLD | n]

```

Specifies the weight of the line either as one of the following keywords or in linewidths (1 linewidth = .01 inch). Specify 0 if you want invisible borders (type and color are then ignored).

LIGHT

The same as **LINEWT 1** (.01 inch)

MEDIUM

The same as **LINEWT 2** (0.2 inch)

BOLD

the same as **LINEWT 3** (.03 inch)

LINETYPE Subcommand

```
LINETYPE [SOLID | DOTTED | SHORTDASH | DASHDOT | DBLDOT | LONGDASH |
DSHDBLDOT] [COLOR colorname]
```

Specifies the line type using one of these keywords:

SOLID

DOTTED

SHORTDASH

DASHDOT

DBLDOT (double dot)

LONGDASH

DSHDBLDOT (dash double dot)

COLOR*colorname*

Specifies the color to be used for the line. The color name must be either one of the pre-defined **OCA** keywords or the color name from the **DEFINE COLOR** command.

COPY Subcommand

```
COPY [ACROSS | DOWN] n
[SPACED [DIAMETER | n [IN | MM | CM | POINTS | PELS]]]]
```

Repeats the same circle at regular intervals either across or down the page. The total number of circles is one more than the value specified on this parameter.

SPACED

Specifies the spacing between the lines.

DIAMETER

The circles are placed to join at one point with the center positions of each being one diameter width apart.

See Figures [Repeating Circles with .45 Inch Spacing \(Not to Scale\)](#), p. 299 and [Repeating Circles with DIAMETER Spacing \(Not to Scale\)](#), p. 299 for a pictorial view of repeating circles.

Repeating Circles with .45 Inch Spacing (Not to Scale)

Repeating Circles with DIAMETER Spacing (Not to Scale)

FILL Subcommand

```
[FILL [ALL | CIRCLE n]
[SOLID | NOFILL | DOT01 | DOT02 | DOT03 |
DOT04 | DOT05 | DOT06 | DOT07 | DOT08 | VERTLN | HORZLN |
BLTR1 | BLTR2 | TLBR1 | TLBR2] [COLOR colorname]]...
```

Specifies that a circle is to be filled with a pre-defined GOCA pattern and optionally specifies a fill color.

If more than one **FILL** subcommand applies to a circle, the last **FILL** wins.

ALL

Fill all boxes. This is the default.

CIRCLE *n*

Specifies the circle to be filled. Circles are numbered in the order that they are defined by the **COPY** parameter, starting with 1.

SOLID | **NOFILL** | **DOT01** | **DOT02** | **DOT03** | **DOT04** | **DOT05** | **DOT06** | **DOT07** | **DOT08** | **VERTLN** | **HORZLN** | **BLTR1** | **BLTR2** | **TLBR1** | **TLBR2**

Specifies the fill pattern to use. For an example of the various GOCA-supported fill patterns, see [Fill Patterns for DRAWGRAPHIC Commands](#), p. 479.

NOFILL

The **NOFILL** keyword can be used when a series of circles has been specified as filled and one or more of them are to be left empty.

RENDER Subcommand

```
RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}
```

Specifies the rendering intent (RI) for a defined graphic (GOCA) object within a page definition. RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC).

↓ **Note**

1. See [AFP Color Management, p. 164](#) for more information about using the **RENDER** subcommand.
2. See the current level of the ICC Specification for more information on RI.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

CMR Subcommand

```
[CMR cmr]name {AUDIT | INSTR | LINK}]...
```

Specifies a Color management resource (CMR) and its process mode for a graphics object within the page definition.

↓ **Note**

See [AFP Color Management, p. 164](#) for more information about using the **CMR** subcommand.

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

↓ **Note**

This parameter must immediately follow the **CMR** keyword.

Processing mode parameter

Specify the processing mode for the CMR.

AUDIT

Process this CMR as an audit CMR.

INSTR

Process this CMR as an instruction CMR.

LINK

Process this CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs.

Code Example: The following examples show how to define CMRs and rendering intent for graphics objects. Rendering intent and a CMR are defined for Record Format and XML page definitions. These are the only two page definition types for which **DRAWGRAPHIC** commands are legal.

```
DEFINE mycmr CMRNAME ... ;

PAGEDEF cmr11L REPLACE yes;
  FONT f1;
  LAYOUT 'L1';
  DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
  RENDER relcm CMR myCMR audit;

PAGEDEF cmr11X REPLACE yes;
  FONT f1 TYPE ebcdic;
  XLAYOUT QTAG 'x1';
  DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
  RENDER relcm CMR myCMR audit;
```

3

DRAWGRAPHIC ELLIPSE Command (Record Format and XML)

```
DRAWGRAPHIC ELLIPSE
[POSITION LPOS [[(+)] | (-)] horiz [IN | MM | CM | POINTS | PELS]]
NEXT [[LPOS | CPOS] [[(+)] | (-)] vert [IN | MM | CM | POINTS | PELS]]
AXIS1 [[(+)] | (-)] n [IN | MM | CM | POINTS | PELS]
[[+)] | (-)] n [IN | MM | CM | POINTS | PELS]
AXIS2 [[(+)] | (-)] n [IN | MM | CM | POINTS | PELS]
[[+)] | (-)] n [IN | MM | CM | POINTS | PELS]
[LINWEW [MEDIUM | LIGHT | BOLD | n]]
[LINETYPE [SOLID | DOTTED | SHORTDASH | DASHDOT | DBLDOT | LONGDASH |
DSHDBLDOT] [COLOR colorname]]
[FILL [SOLID | NOFILL | DOT01 | DOT02 | DOT03 |
DOT04 | DOT05 | DOT06 | DOT07 | DOT08 | VERTLN | HORZLN |
BLTR1 | BLTR2 | TLBR1 | TLBR2] [COLOR colorname]]...
[RENDER {PERCEPTUAL | SATURATION | RELCM | ABSCM}]
[CMR cmrname {AUDIT | INSTR | LINK}]... ;
```

The **DRAWGRAPHIC ELLIPSE** command allows you to draw ellipses on the page by generating GOCA (Graphics Object Content Architecture) structure fields. You can create an ellipse with a number of positions showing the major and minor axes at a specified distance from the last line printed.

Note

GOCA lines require specific microcode in your printer.

DRAWGRAPHIC ELLIPSE can be used with the **COLOR** parameter and **DEFINE COLOR** to shade an ellipse with a percentage of black or other colors.

Subcommands

POSITION Subcommand

```
POSITION LPOS [[(+)|(-)] horiz {IN | MM | CM | POINTS | PELS}]
NEXT [[LPOS | CPOS] [(+)|(-)] vert {IN | MM | CM | POINTS | PELS}]
```

Specifies the horizontal and vertical position of the ellipse.

LPOS

Specifies the layout position. If **LPOS** is used alone, the position is the same position as is specified on the **LAYOUT** command. If it is used with a + or - value, the position moves that amount from the **LAYOUT** position.

CPOS

Specifies the current position. If **CPOS** is used alone, the position is the same position as is specified on the previous **FIELD** or **DRAWGRAPHIC** command command. If it is used with a + or - value, the position moves that amount from the **FIELD** or **DRAWGRAPHIC** command position.

AXIS1 Subcommand

```
AXIS1 [(+)|(-)] n [IN | MM | CM | POINTS | PELS]
[(+)|(-)] n [IN | MM | CM | POINTS | PELS]
```

Specifies the location of one point on the ellipse specified in relation to the **POSITION** parameter on this command. This location is specified as if the **POSITION** parameter is now at (0,0) on a coordinate system. The x and y movements are either in the positive or negative direction from the center point at (0,0). For a picture of how this is used, see Figure [Ellipse Parameters, p. 304](#), point R,Q.

AXIS2 Subcommand

```
AXIS2 [(+)|(-)] n [IN | MM | CM | POINTS | PELS]
[(+)|(-)] n [IN | MM | CM | POINTS | PELS]
```

Specifies the location of a second point on the ellipse specified in relation to the **POSITION** parameter on this command. This location is specified as if the **POSITION** parameter is now at (0,0) on a coordinate system. The x and y movements are either in the positive or negative direction from the center point at (0,0). For a picture of how this is used, see Figure [Ellipse Parameters, p. 304](#), point P,S.

LINEWT Subcommand

```
LINEWT [MEDIUM | LIGHT | BOLD | n]
```

Specifies the weight of the line either as one of the following keywords or in lineweights (1 lineweight = .01 inch). Specify 0 if you want invisible borders (type and color are then ignored).

The same as **LINEWT 1** (.01 inch)

MEDIUM

LIGHT

The same as **LINEWT 2** (0.2 inch)

BOLD

the same as **LINEWT 3** (.03 inch)

LINETYPE Subcommand

```
LINETYPE [SOLID | DOTTED | SHORTDASH | DASHDOT | DBLDOT | LONGDASH |
          DSHDBLDOT] [COLOR colorname]
```

Specifies the line type using one of these keywords:

SOLID

DOTTED

SHORTDASH

DASHDOT

DBLDOT (double dot)

LONGDASH

DSHDBLDOT (dash double dot)

COLOR*colorname*

Specifies the color to be used for the line. The color name must be either one of the pre-defined **OCA** keywords or the color name from the **DEFINE COLOR** command.

FILL Subcommand

```
[FILL [SOLID | NOFILL | DOT01 | DOT02 | DOT03 |
      DOT04 | DOT05 | DOT06 | DOT07 | DOT08 | VERTLN | HORZLN |
      BLTR1 | BLTR2 | TLBR1 | TLBR2] [COLOR colorname]]...
```

Specifies that the ellipse is to be filled with a pre-defined GOCA pattern and optionally specifies a filling color. For an example of the various GOCA-supported fill patterns, see [Fill Patterns for DRAWGRAPHIC Commands, p. 479](#).

Ellipse Parameters

The dot in the center of the ellipse shows the **POSITION** parameter. The asterisk shows the major axis position and star shows the minor axis position.

RENDER Subcommand

RENDER { PERCEPTUAL | SATURATION | RELCM | ABSCM }

Specifies the rendering intent (RI) for a defined graphic (GOCA) object within a page definition. RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC).

Note

1. See [AFP Color Management, p. 164](#) for more information about using the **RENDER** subcommand.
2. See the current level of the ICC Specification for more information on RI.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

CMR Subcommand

```
[CMR cmr]name {AUDIT | INSTR | LINK}]...
```

Specifies a Color management resource (CMR) and its process mode for a graphics object within the page definition.

Note

See [AFP Color Management, p. 164](#) for more information about using the **CMR** subcommand.

cmr-name

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

Note

This parameter must immediately follow the **CMR** keyword.

Processing mode parameter

Specify the processing mode for the CMR.

AUDIT

Process this CMR as an audit CMR.

INSTR

Process this CMR as an instruction CMR.

LINK

Process this CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs.

Code Example: The following examples show how to define CMRs and rendering intent for graphics objects. Rendering intent and a CMR are defined for Record Format and XML page definitions. These are the only two page definition types for which **DRAWGRAPHIC** commands are legal.

```
DEFINE mycmr CMRNAME ... ;

PAGEDEF cmr11L REPLACE yes;
  FONT f1;
  LAYOUT 'L1';
```

```

DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
  RENDER relcm CMR myCMR audit;

PAGEDEF cmr11X REPLACE yes;
  FONT f1 TYPE ebcdic;
  XLAYOUT QTAG 'x1';
  DRAWGRAPHIC BOX BOXSIZE 1 in 2 in
    RENDER relcm CMR myCMR audit;

```

ENDGRAPHIC Command (Record Format and XML)

3

```

ENDGRAPHIC [GRAPHID {00 | nn}]
[NEXT | [LPOS | CPOS] [(+) | (-)]
[vert] [IN | MM | CM | POINTS | PEL]] ;

```

The **ENDGRAPHIC** command allows you to end all active graphics with a matching graphic ID. An active graphic is one that has been started but not ended, for example a vertical line or a box with no vertical size.

Subcommands

GRAPHID Subcommand

```
GRAPHID {00 | nn}
```

Specifies the graphic ID of the graphics to close. This ID must match one previously defined in a **DRAWGRAPHIC** command. If no **GRAPHID** is specified, all **DRAWGRAPHIC** commands that have no **GRAPHID** are closed (for example, **GRAPHID 00**).

NEXT or LPOS or CPOS Subcommand

```
[NEXT | [LPOS | CPOS] [(+) | (-)]
[vert] [IN | MM | CM | POINTS | PEL]]
```

Specifies the position where the graphics should end.

NEXT

Specifies that the layout position moves down (on the logical page) one line (as defined in the **LINESP** subcommand of the last **SETUNITS** command) from the previous field. The **LINESP** subcommand of the **SETUNITS** command establishes the distance from one line to the next.

LPOS

Specifies the layout position. If **LPOS** is used alone, the position is the same position as is specified on the **LAYOUT** command. If it is used with a + or - value, the position moves that amount from the **LAYOUT** position.

vert

This value is relative to the layout position. If not specified, the graphics are closed one line spacing from the layout position.

CPOS

Specifies the current position. If **CPOS** is used alone, the position is the same position as is specified on the previous **FIELD** or **DRAWGRAPHIC** command command. If it is used with a **+** or **-** value, the position moves that amount from the **FIELD** or **DRAWGRAPHIC** command position.

vert

This value is relative to the current position. If not specified, the graphics are closed one line spacing from the current position.

3

ENDSUBPAGE Command (Traditional)

```
ENDSUBPAGE ;
```

The **ENDSUBPAGE** command is used to identify the end of a subpage for conditional processing.

You can specify the **ENDSUBPAGE** command at any point in a page definition command stream where a **PRINTLINE** or **LAYOUT** command can occur. However, you must not enter the **ENDSUBPAGE** command between a **PRINTLINE** or **LAYOUT** command and its associated **FIELD** or **CONDITION** command.

If an **ENDSUBPAGE** command is not specified, the entire page format is treated as one subpage.

EXTREF Command

```
EXTREF {FONT lname |  
OB2CMR lname {AUDIT | INSTR | LINK} |  
OB2R [i2name | 'i2name' | C'i2name' | E'i2name' | A'i2name' X'hhhh']  
OB2XNAME [x2name | 'x2name' | C'x2name' | E'x2name' | A'x2name' |  
X'hhhh' | U8'x2name' | U16'x2name' | X8'hhhh' | X16'hhhh']  
OB2ID [n | type-name]} ;
```

If an object contains another mapped object, the contained object must be mapped, but if the object is not known to PPFA, PPFA will not automatically map that object. The **EXTREF** command allows you to map unknown objects in the page.

For example, if you presented a GOCA object that contained a mapped font, CMR, and/or another object, those resources will not be mapped in the page. The **EXTREF** command can be used to map this required resource.

Note

Even though a font is mapped automatically by PPFA when it is used internally in the page definition on a **PRINTLINE**, **LAYOUT**, **XLAYOUT**, or **FIELD** command, a font that is used in an included object, such as a GOCA object, is not known to PPFA and consequently not mapped. In that case the user must define that font with either a **FONT** or **DOFONT** command and map it with the **EXTREF** command.

Subcommands

FONT Subcommand

FONT *lname*

Specifies a font to be mapped. **FONT** is the default if **FONT**, **OB2CMR**, or **OB2R** is not specified.

lname

Specifies the local name for a font. This is an unquoted alphanumeric name of 1 to 16 characters that is to be used in this page definition. The name must be unique within this page definition. *lname* is the name used in the **FONT** or **DOFONT** commands which define the font.

OB2CMR Subcommand**OB2CMR** *lname* {**AUDIT** | **INSTR** | **LINK**}

Specifies a color management resource (CMR) and its process mode for a data object specified within an included object. CMRs are secondary objects when used at this level. An object specified here will be mapped with “object” scope.

Note

See [AFP Color Management, p. 164](#) for more information about using the CMR subcommand.

cmr-lname

Specifies The CMR local name. This name must have been defined with a **DEFINE CMR** command.

processing-mode-parameter

Specifies the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the **CMR** as a link CMR. This processing mode is only

valid for device link (DL) CMRs. The PPFA command RENDER is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

OB2R Subcommand

```
OB2R [ i2name | 'i2name' | C'i2name' | E'i2name' | A'i2name' X'hhhh' ]
```

Specifies a secondary object to be mapped.

If an included object contains a reference to one or more secondary objects, you must identify them at this point. Specify the internal name for the secondary resource as specified in the included resource. If the internal name contains special characters such as periods or blanks, then quotes must surround the name.

i2name

An unquoted name up to 250 characters long will be folded to upper case and translated into EBCDIC if necessary.

'*i2name*'

A quoted name up to 250 characters long will be accepted as-is with no case folding or translation.

C'*i2name*'

A quoted name with a "C" for Character will be treated the same as a quoted name of up to 250 characters. No folding or translation will be done.

E'*i2name*'

A quoted name with an "E" for EBCDIC entered with up to 250 characters will be accepted as-is if on an EBCDIC platform or translated to EBCDIC if on an ASCII platform. The translation will be made with no case folding.

A'*i2name*'

A quoted name with an "A" for ASCII entered with up to 250 single-byte characters will be accepted as-is if on an ASCII platform or translated to ASCII if on an EBCDIC platform. The translation will be made with no case folding.

X'*hhhh*'

A quoted name with an "X" for Hexadecimal entered with up to 500 hexadecimal characters. The characters will be translated to hexadecimal, but no assumptions of data type will be made.

OB2XNAME Subcommand

```
OB2XNAME { x2name | 'x2name' | C'x2name' | E'x2name' | A'x2name' | X'hhhh' | U8'x2name' | U16'x2name' | X8'hhhh' | X16'hhhh' }
```

Specifies the external name for a secondary resource object. If the name contains special characters or blanks, then quotes must surround the name.

x2name

An unquoted name up to 250 characters long will be folded to upper case and translated into EBCDIC if necessary.

'x2name'

A quoted name up to 250 characters long will be accepted as-is with no case folding or translation.

C'x2name'

A quoted name with an "C" for Character will be treated the same as a quoted name up to 250 characters. No folding or translation is done.

E'x2name'

A quoted name with an "E" for EBCDIC entered with up to 250 single-byte characters will be accepted as-is if on an EBCDIC platform or translated to EBCDIC if on an ASCII platform. The translation will be made with no case folding.

A'x2name'

A quoted name with an "A" for ASCII entered with up to 250 single-byte characters will be accepted as-is on an ASCII platform or translated to ASCII if on an EBCDIC platform. The translation will be made with no case folding.

U8'x2name'

A quoted name with a "U8" for UTF-8 entered with up to 250 single-byte characters will be translated to UTF-8.

U16'x2name'

A quoted name with a "U16" for UTF-16 entered with up to 125 single-byte characters will be translated to UTF-16.

X'hhhh'

A quoted name with an "X" for Hexadecimal entered with up to 500 hexadecimal characters. The characters will be translated to hexadecimal, but no assumption of data type will be made.

X8'hhhh'

A quoted name with an "X8" for UTF-8 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-8. There must be a multiple of 2 hexadecimal characters entered.

X16'hhhh'

A quoted name with an "X16" for UTF-16 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-16. There must be a multiple of 4 hexadecimal characters entered.

OB2ID Subcommand

OB2ID { <i>n</i> <i>type-name</i> }
--

Specifies a component type identifier for a secondary resource, as specified in object-type list adjustments..

Object Types That Can Be Referenced as Secondary Resources

Type Name	Component ID	Description of OID Type Name
PDFRO	26	PDF Resource Object (new)
RESCLRPRO	46	Resident Color Profile Resource Object
IOCAFS45RO	47	IOCA FS45 Resource Object Tile (new)

n

An object type number from the “Component ID” column of Table [Object Types That Can Be Referenced as Secondary Resources](#), p. 311.

type-name

An object type name from the “Type name ” column of Table [Object Types That Can Be Referenced as Secondary Resources](#), p. 311.

3

Example:

In the example below, the fonts `ocaf`, `fontA`, and `fontABI` and the CMR `rvtc` are mapped in the Object Environment Group (OEG) of an object that is being included in the page.

Without the **EXTREF** commands, only the font `varb` would be mapped because only it is being called out in the PPSA source code. Also, without the **EXTREF** command, the CMR `rvtc` will not be mapped.

Note

1. The fonts coded in the **EXTREF** commands must also be defined in a **FONT** command.
2. If `rvtc` is coded with a **CMR** command (as in the commented out **CMR** command) it will be mapped, but will be active for the entire page. Coding it with an **EXTREF** command makes it active only for the object in whose OEG it is mapped.

```
PAGEDEF cmr42  replace yes;
  FONT  varb  gt10  ;                /*Variable data          */
  FONT  ocaf  CS N40090 CP 000395; /* mapped in OEG         */
  DOFONT fontA 'Arial' Height 12;
  DOFONT fontABI 'Arial Bold Italic'
           UDTYPE EBCDIC CP 'T1V10500';

  DEFINE rvtc CMRNAME
'RevVideoTC001.000@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
'@@@@@'

  SETUNITS  LINESP .25 in ;          /* Line spacing          */

  PAGEFORMAT rept1  TOPMARGIN .25 in;
  EXTREF ocaf;
  EXTREF fontA;
  EXTREF fontABI;
  EXTREF OB2CMR rvtc instr;

/* CMR rvtc instr;          */
LAYOUT 'startline' BODY  newpage POSITION .5 in SAME FONT varb;
LAYOUT 'plaindata' BODY  POSITION .5 in NEXT FONT varb;
```

FIELD Command

FIELD Command (Traditional)

```
FIELD [TEXT [[Dn] [C | X | G | K] [L (m)] 'text'...] |
      [START n] LENGTH n]

```

The **FIELD** command identifies a field in a data record or supplies a field of constant text, and positions where the field is on the page. More than one position on the page can be specified.

FIELD commands:

- Are subordinate to a **PRINTLINE** command (Traditional), **LAYOUT** command (Record Format), or **LAYOUT** subcommand (XML)
- Must follow a **PRINTLINE** command (Traditional) or a **LAYOUT** command (Record Format)
- Must contain either a **LENGTH** subcommand or a **TEXT** subcommand (Traditional only)

The **FONT**, **DIRECTION**, and **COLOR** subcommands do not have fixed defaults. If any of these subcommands is omitted, the value for the omitted subcommand is obtained from the corresponding subcommand in the **PRINTLINE** command (Traditional), **LAYOUT** command (Record Format), or **LAYOUT** subcommand (XML).

3

Subcommands

START Subcommand

START *n*] **LENGTH** *n*

Specifies the starting byte in the data record for the desired field.

n

Specifies the number of bytes from the first data byte in the record to be used as the starting point of the field. The first data byte position of an input record is 1.

Note

The carriage-control character, table-reference character, and record ID are not considered data.

*

Denotes the next byte after the field identified in the previous **FIELD** command, excluding **FIELD** commands with constant **TEXT**.

+ *n*

Adds the value of *n* to the * byte position.

-*n*

Subtracts the value of *n* from the * byte position.

If **START** is omitted and **LENGTH** is specified, then **START** * is assumed.

LENGTH *n*

Specifies the number (*n*) of bytes to process from the data record, beginning with the position specified in **START**.

Record Format

Once the maximum length of the field has been determined, the print server truncates all the fields not containing data.

TEXT Subcommand

```
{TEXT {[Dn] [C | X | G | K] [L (m)] 'text'}...
```

Specifies the constant text that is to be printed in the output. A maximum of 65,535 bytes of text can be provided in one page format.

Note

This text is considered constant in that the same text is printed each time. In reference to the **CONSTANT** command within a form definition, this text is considered variable because the text prints only where variable data is allowed to print.

D_n

Specifies the number of times the text is to be repeated (use a decimal number). The maximum times the text is repeated varies depending on the size of the text. The default is 1.

{C | X | G | K }

Specifies the type of text.

C

Indicates that the text contains single-byte code characters, which includes all Roman alphabetic characters (for example, those used for English). Any valid character code can be specified, including blanks. This is the default.

X

Indicates that the text contains hexadecimal codes (in groups of two hexadecimal codes) that specify values from X'00' through X'FE'.

G

Indicates that the text contains double-byte code characters (for example, kanji characters).

Characters in type **G** text must start with shift-out (SO X'0E') and end with shift-in (SI X'0F') characters within opening and closing apostrophes (X'7D' for EBCDIC platforms and X'27 ' for ASCII platforms) .

K

Indicates that the text contains kanji numbers enclosed in apostrophes. Kanji numbers are separated by commas:

```
K' 321 ,400'
```

Valid double-byte character set (DBCS) codes are from X'41' through X'FE' for each byte. Code X'4040' (blank) is the only exception.

Valid

```
X'4040', X'4141', X'41FE' X'FE41', X'FEFE'
```

Invalid

```
X'2040', X'413E', X'4100' X'7F00', X'FE3E'
```

L(*m*)

Specifies the length of text (use a decimal number in parentheses). When the actual length of the text is different from *m*, the *m* specification is honored. That is, the text is either padded with blanks to the right or truncated.

'*text*'

Specifies the text.

Examples:

- When TEXT 2C(3)'AB' is specified, 'AB AB ' is generated. The blanks are generated because of the (3) specification.
- TEXT 2C(1)'AB' generates 'AA', truncating the Bs.

PAGENUM Subcommand (Record Format and XML)

```
PAGENUM [NOPRINT | PRINT] [NORESET | RESET n]
```

If you specify the **PAGENUM** subcommand, you must specify at least one parameter.

NOPRINT

Do not print the page number. This is the default.

PRINT

Print page numbers.

Note

If you specify **PRINT**, you should define a font that specifies the font type to be used for printing page numbers.

NORESET

Do not reset the page number. This is the default. Page numbers follow the specification in the **PAGEDEF** or **PAGEFORMAT** command.

RESET *n*

Reset the page number for this page to *n*.

FLDNUM Subcommand (Record Format and XML)

```
FLDNUM n [START [1 | n]] [LENGTH [rest of field | n]]
```

To allow for the identification of a part of a field which is field delimited, **FLDNUM** specifies the starting position (from the delimiter), and optionally the length of the part of the field you want to use. The **LENGTH** default is to use the entire remainder of the field from the start position to the ending delimiter.

Important

You should use **FLDNUM** only if the **DELIMITER** field was used in the **LAYOUT** command. Fields cannot be counted without delimiters being specified in the database.

RECID Subcommand (Record Format)

```
RECID [START [1 | n]] [LENGTH [rest of ID | n]]
```

RECID allows you to access characters in the first *n* characters of a record. This area is reserved for the record identifier, and all other field starts and lengths are calculated after this area. These starts and lengths reference only the area within the record ID.

If no record length is specified, the remaining bytes of the *n*-byte field is assumed.

STAG Subcommand (XML)

```
STAG [START [1 | n]] [LENGTH [rest of ID | n | *]]
```

This keyword allows you to access characters in the the **START** tag. It also includes the "<" ">" delimiters, so that position 1 is always the "<" delimiter.

If no record length is specified, the remaining bytes of the **START** tag is assumed. If no **START** is specified, 1 is assumed.

LENGTH * means using the remainder of the field for the length.

ATTR Subcommand (XML)

```
ATTR aname [START {1 | n}] [LENGTH {rest of attribute | n | *}]
```

This keyword allows you to access attribute values from the data. Multiple attribute fields can access the same attribute allowing subsets of the value to be printed.

aname

The attribute name. To preserve the case, enter the name in quotes. The name is converted to the data type you specify, using **UDTYPE** on the page definition, or it is defaulted.

START *n*

The starting position of the attribute to extract the data. If this parameter is omitted, position 1 is assumed.

LENGTH *n*

The length of the attribute to be placed. If this parameter is omitted or **LENGTH *** is coded, the rest of the field is assumed for the length.

POSITION Subcommand

Traditional

```
POSITION {[-] x-pos | {CURRENT | *} }
          {[-] y-pos | {CURRENT | * } | NEXT}
```

Record Format

```
POSITION {[-] x-pos | {CURRENT | *} }
          {[-] y-pos | {CURRENT | * } | NEXT}
```

XML

```
POSITION {CURRENT | *} | LPOS {0 | [-] x pos } |
          CPOS {0 | x pos } | APOS x pos }
          {CURRENT | *} | LPOS [-] x pos | NEXT}
```

Specifies the starting position of the field in the printout.

X position

Do not mix *x-pos* specifications with **CURRENT** or ***** except in **ACROSS** fields.

-

Specifies that the *x-pos* value is negative.

x-pos

Specifies the horizontal offset for the starting print position relative to the *printline starting position*. The choices are **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

The default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

The **PELS** measurement equals one L-unit or 1/240 of an inch, depending on whether the **PELSPERINCH** parameter had been specified previously.

APOS

Specifies that the *x-pos* parameter that follows is absolute. The *x-pos* parameter is mandatory and must be positive.

CPOS

Specifies that the *x-pos* parameter that follows is relative to the current position. This parameter can be negative.

LPOS

Specifies that the *x-pos* parameter that follows is relative to the **XLAYOUT** position. This parameter can be negative.

CURRENT

Specifies that the inline offset (relative to the field's direction) is the end of the previous field. For the first field, use the **PRINTLINE** offset. This is the default.

Note

The meaning of **CURRENT** differs from the meaning of the **PRINTLINE**, p. 405 command parameter (Traditional) or a **LAYOUT** command parameter (Record Format) **SAME**.

*

Alternate for **CURRENT**.

Y position

Do not mix *y-pos* specifications with **CURRENT** or * except in **ACROSS** fields.

-

Specifies that the *y-pos* value is negative.

y-pos

Specifies the vertical offset for the starting print position relative to the *printline starting position*. The choices are **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

The default is the most recent **SETUNITS**, p. 425 command value or **IN** (inch) if a **SETUNITS** command has not been issued.

NEXT

Specifies a field that is positioned down one line in the baseline direction (as defined in the **SETUNITS** command **LINESP** subcommand) from the previous field.

Use **NEXT** only in **ACROSS** fields.

CURRENT

Specifies that the baseline offset (relative to the field's direction) is the same as the previous field. That is, the baseline position does not change. For the first field, use the **PRINTLINE** (Traditional) or a **LAYOUT** (Record Format) offset. This is the default.

*

—

Alternate for **CURRENT**.

FONT Subcommand

```
FONT name1 [, name2]
```

Defines the font to be used for the field.

name1

Specifies the local name of a font used to print the data. This font must have been defined in a previous **FONT** or **DOFONT** command in this page definition.

If Shift-Out, Shift-In (SOSI) processing is used, *name1* must be the single-byte font.

name2

Specify only when using Shift-Out, Shift-In (SOSI) processing to dynamically switch between a single-byte font and a double-byte font within the field. *name2* must be the double-byte font.

↓ Note

name2 is only valid with EBCDIC data.

↓ Note

1. If the **FONT** subcommand is not specified, the font specified in the preceding **PRINTLINE** command (Traditional) or **LAYOUT** command (Record Format) is used. If neither has been specified, the print server assigns a font.]
2. **Record Format only:** For ASCII, UTF-8, or UTF-16 data, the entire **PRINTLINE** command must be one font. To use multiple font mappings for a line in ASCII, UTF-8, or UTF-16 you must use the **FIELD** command.

ALIGN Subcommand (Record Format and XML only)

```
ALIGN {LEFT | RIGHT}
```

The data in this field is left or right aligned to the X position specified in the horizontal **POSITION** parameter.

DIRECTION Subcommand

```
DIRECTION {ACROSS | DOWN | BACK | UP}
```

Specifies the print direction of the field, relative to the upper-left corner as you view the logical page. If this subcommand is omitted, the direction specified in the governing **PRINTLINE**, p. 405 command is used.

ACROSS

The page is printed with the characters added from *left to right* on the page, and the lines are added from the top to the bottom.

DOWN

The page is printed with the characters added from *top to bottom* on the page, and the lines added are from the right to the left.

BACK

The page is printed with the characters added from *right to left* on the page, and the lines are added from the bottom to the top.

UP

The page is printed with the characters added from *bottom to top* on the page, and the lines are added from the left to the right.

↓ Note

1. Not all printers can print in all directions. Refer to your printer documentation for more information.
2. If the page rotation is not zero, then the direction is relative to the rotated origin of the page.

SUPPRESSION Subcommand

SUPPRESSION *name*

Specifies that printing of this text field can be suppressed by a **SUPPRESSION** command within the form definition.

name

Specifies the name that identifies this field in the **SUPPRESSION** command. The same name can be used in one or more fields to suppress these fields as a group.

↓ Note

SUPPRESSION is not valid for barcodes.

COLOR Subcommand

COLOR *colorname*

Specifies an OCA or defined color for the text of this field. This subcommand is recognized only by printers that support multiple-color printing. Refer to your printer publication for more information.

colorname

The value for *colorname* can be a defined color (see [DEFINE COLOR Command, p. 279](#)), or an OCA color name. OCA color names are:

BLUE

RED

MAGENTA (or **PINK**)

GREEN

CYAN (or **TURQ**)

YELLOW

BLACK

BROWN

MUSTARD

DARKBLUE (or **DBLUE**)

DARKGREEN (or **DGREEN**)

DARKTURQ (**DTURQ**, or **DCYAN**, or **DARKCYAN**)

ORANGE

PURPLE

GRAY
NONE
DEFAULT

The color choices depend on the printer.

↓ **Note**

In some printer publications, the color turquoise (**TURQ**) is called “cyan”, and the color pink (**PINK**) is called “magenta”.

Color Model Subcommands

These subcommands specify the color of print for this field supported in MO:DCA for the Red/Green/Blue color model (**RGB**), the highlight color space, the Cyan/Magenta/Yellow/Black color model (**CMYK**), and the **CIELAB** color model.

Color Model Using the FIELD Command

```
FIELD START 1 LENGTH 5
                COLOR BLUE ;
FIELD START 1 LENGTH 1
                RGB 10 75 30 ;
FIELD START 1 LENGTH 1
                cmyk 80 10 10 10 ;
FIELD START 1 LENGTH 2
                CIELAB 80 100 20 ;
FIELD START 1 LENGTH 2
                highlight 5 ;
FIELD START 1 LENGTH 2
                highlight 300 COVERAGE 50 BLACK 30 ;
```

RGB Subcommand

```
RGB rvalue gvalue bvalue
```

Three **RGB** integer values are used. The first (*rvalue*) represents a value for red, the second (*gvalue*) represents a value for green, and the third (*bvalue*) represents a value for blue. Each of the three integer values may be specified as a percentage from 0 to 100.

↓ **Note**

An **RGB** specification of 0/0/0 is black. An **RGB** specification of 100/100/100 is white. Any other value is a color somewhere between black and white, depending on the output device.

HIGHLIGHT Subcommand

```
HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue]
```

Indicates the highlight color model.

hvalue

An integer within the range of 0 to 65535 that identifies a device-dependent default highlight color.

Note

An *hvalue* of 0 indicates that there is no default value defined; therefore, the default color of the presentation device is used.

COVERAGE *cvalue*

indicates the percentage of coverage of the highlight color to be used. You can use an integer within the range of 0 to 100 for the *cvalue*. If less than 100 percent is specified, the remaining coverage is achieved with the color of the medium.

Note

Fractional values are ignored. If **COVERAGE** is not specified, a value of 100 is used as a default.

BLACK *bvalue*

Indicates the percentage of black to be added to the highlight color. You can use an integer within the range of 0 to 100 for the *bvalue*. The amount of black shading applied depends on the **COVERAGE** percentage, which is applied first. If less than 100 percent is specified, the remaining coverage is achieved with black.

Note

If **BLACK** is not specified, a value of 0 is used as a default.

CMYK Subcommand

```
CMYK cvalue mvalue yvalue kvalue
```

Defines the cyan/magenta/yellow/black color model. *Cvalue* specifies the cyan value. *Mvalue* specifies the magenta value. *Yvalue* specifies the yellow value. *Kvalue* specifies the black value. You can use an integer percentage within the range of 0 to 100 for any of the **CMYK** values.

CIELAB Subcommand

```
CIELAB Lvalue (-) c1value (-) c2value
```

Defines the **CIELAB** model. Use a range of 0.00 to 100.00 with *Lvalue* to specify the luminance value. Use signed integers from -127 to 127 with *c1value* and *c2value* to specify the chrominance differences.

Lvalue, *c1value*, *c2value* must be specified in this order. There are no defaults for the subvalues.

Note

Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **FIELD** or **PRINTLINE** command. The output is device-dependent and may not be what you expect.

BARCODE Subcommand

```
[BARCODE [name] [TYPE {n | type-name}]
[Common BARCODE Parameters]
[Common 2D BARCODE Parameters]
[Concatenated BARCODE Parameters]]
```

Specifies a bar code in a page definition. The following are valid barcode type names:

CODE39 (same as 1)
MSI (same as 2)
UPCA (same as 3)
UPCE (same as 5)
UPC2SUPP (same as 6)
UPC5SUPP (same as 7)
EAN8 (same as 8)
EAN13 (same as 9)
IND2OF5 (same as 10)
MAT2OF5 (same as 11)
ITL2OF5 (same as 12)
CDB2OF7 (same as 13)
CODE128 (same as 17)
EAN2SUP (same as 22)
EAN5SUP (same as 23)
POSTNET (same as 24)
RM4SCC (same as 26)
JPOSTAL (same as 27)
2DMATRIX (same as 28)
2DMAXI (same as 29)
2DPDF417 (same as 30)
APOSTAL (same as 31)
2DQRCODE (same as 32)
CODE93 (same as 33)
US4STATE (same as 34)
REDTAG (same as 35)
DATABAR (same as 36)

The bar code name can be 1-8 characters long. Refer to your printer documentation for additional information about bar code support. Ensure that the bar code fits on the page or you will get errors at print time.

Please read your printer hardware documentation before using bar codes. The documentation indicates which bar code types, modifiers, **MODWIDTH**, element heights, and ratio values are valid for the printer.

PPFA does minimal verification of the bar code values. If you use the **MOD**, **HEIGHT**, **MODWIDTH**, and **RATIO** parameters, ensure that the values you specify are valid for your printer.

For printer optimization, specify **BARCODE** *name options* in the first instance of a specific type of bar code. If this type is used again, position it as usual with **START**, **LENGTH**, and **POSITION**, but specify the barcode information using only **BARCODE** *same-name-as-previously*. The **BARCODE**

subcommand is recognized only by printers that support BCOCA bar code printing; refer to your printer documentation for more information.

For more information about bar codes, see [More About Bar Code Parameters, p. 452](#) and refer to *Data Stream and Object Architectures: Bar Code Object Content Architecture Reference, S544-3766*.

name

Specifies a specific bar code name to be included in a page definition. The name is required if **BARCODE** will be used to reference or continue the bar code later, as is done for bar code concatenation.

TYPE {*n* | *type-name* }

Specifies the type of bar code symbol to be generated and included in a page definition.

Note

If a type indicates “(same as *n*)”, you may substitute the number given for the character name.

The following bar code types are supported:

CODE39 (same as **1**)

Specifies a bar code type of Code 39 (3-of-9 code), Automatic Identification Manufacturers Uniform Symbol Specification 39.

MSI (same as **2**)

Specifies a bar code type of modified Plessey code.

UPCA (same as **3**)

Specifies a bar code type of Universal Product Code (United States) and the Canadian Grocery Product Code, Version A

UPCE (same as **5**)

Specifies a bar code type of Universal Product Code (United States) and the Canadian Grocery Product Code, Version E

UPC2SUPP (same as **6**)

Specifies a bar code type of Universal Product Code (United States) two-digit Supplemental (periodicals).

UPC5SUPP (same as **7**)

Specifies a bar code type of Universal Product Code (United States) five-digit Supplemental (paperbacks).

EAN8 (same as **8**)

Specifies a bar code type of European Article Numbering 8 (includes Japanese Article Numbering-short).

EAN13 (same as **9**)

Specifies a bar code type of European Article Numbering 13 (includes Japanese Article Numbering-standard).

IND2OF5 (same as **10**)

Specifies a bar code type of Industrial 2-of-5.

MAT2OF5 (same as **11**)

Specifies a bar code type of Matrix 2-of-5.

ITL2OF5 (same as **12**)

Specifies a bar code type of Interleaved 2-of-5, Automatic Identification Manufacturers Uniform Symbol Specification-I 2/5.

CDB2OF7 (same as **13**)

Specifies a bar code type of Codabar, 2-of-7, Automatic Identification Manufacturers Uniform Symbol Specification-Codabar.

CODE128 (same as **17**)

Specifies a bar code type of Code 128, Automatic Identification Manufacturers Uniform Symbol Specification-128.

↓ **Note**

There is a subset of **CODE128** called **EAN128**. These **EAN128** bar codes can be produced with PPFA by specifying **CODE128** for the bar code type in the **PAGEDEF** and including the “extra” parts of the bar code in the data. The **UCC-128** bar code format is:

```
startcode FNC1 ai nnnnnnnnnnnnnnnnnn m c stopchar
```

The string of *n*'s represents the bar code data. The start code, stop character, and *c* value are generated by the printer microcode for BCOCA bar codes. The FNC1 is a hexadecimal 8F character. The *ai* is an application identifier and needs to be defined for use by each EAN128 application. The *m* is a modulo 10 check digit that must be calculated by the application and included in the bar code data.

Not all printers generate the **EAN128** bar codes, thus you may need to verify that the bar code produced in this manner is readable by your bar code scanner.

EAN2SUP (same as **22**)

Specifies a bar code type of European Article Numbering, Two-digit Supplemental.

EAN5SUB (same as **23**)

Specifies a bar code type of European Article Numbering, Five-digit Supplemental.

POSTNET (same as **24**)

Specifies a bar code type of POSTal Numeric Encoding Technique (United States Postal Service), and defines specific values for the BSD module width, element height, height multiplier, and wide-to-narrow ratio fields.

↓ **Note**

POSTNET MOD 4 is normally called PLANET bar code. **POSTNET MOD 4** is supported by PPFA and some AFP printers.

RM4SCC (same as **26**)

Specifies a 4-state customer code defined by the Royal Mail Postal Service of England for bar coding postal code information.

JPOSTAL (same as **27**)

A complete Japan Postal Bar Code symbol consists of a set of distinct bars and spaces for each character followed by a modulo 19 checksum character and enclosed by a unique start character, stop character and quiet zones.

2DMATRIX (same as **28**)

Specifies a Data Matrix two-dimensional bar code. Two-dimensional matrix symbologies (sometimes called area symbologies) allow large amounts of information to be encoded in a two-dimensional matrix. These symbologies are usually rectangular and require a quiet zone around all four sides; for example, the Data Matrix symbology requires a quiet zone at least one module wide around the symbol. Two-dimensional matrix symbologies use extensive data compaction and error correction codes, allowing large amounts of character or binary data to be encoded.

2DMAXI (same as **29**)

Specifies a MaxiCode two-dimensional stacked bar code. Two-dimensional stacked symbologies allow large amounts of information to be encoded by effectively stacking short one-dimensional symbols in a row/column arrangement. This reduces the amount of space that is typically consumed by conventional linear bar code symbols and allows for a large variety of rectangular bar code shapes.

2DPDF417 (same as **30**)

Specifies a PDF417 two-dimensional stacked bar code. Two-dimensional stacked symbologies allow large amounts of information to be encoded by effectively stacking short one-dimensional symbols in a row/column arrangement. This reduces the amount of space that is typically consumed by conventional linear bar code symbols and allows for a large variety of rectangular bar code shapes.

APOSTAL (same as **31**)

Specifies the barcode type as defined by the Australian Postal Service.

2DQRCODE (same as **32**)

Specifies a QR Code two-dimensional bar code. QR Code consists of a matrix of dark and light squares (modules). The matrix is also square and there are 40 sizes ranging from a matrix of 21 by 21 modules increasing by steps of 4 up to a matrix of 177 by 177 modules. Thus, up to 7089 numeric characters, 4296 alphabetic characters, 2953 8-bit characters, or 1817 Kanji characters can be contained on a single symbol, and up to 16 symbols can be logically linked together.

Since squares (modules) are square, the size of a module is determined by the **MODWIDTH** parameter only. The **HEIGHT** and **RATIO** parameters are not used.

CODE93 (same as **33**)

Specifies a bar code type as defined by the AIM Uniform Symbology Specification - Code 93. This is a linear bar code similar to Code 39, but more complex.

US4STATE (same as **34** or **US4ST**)

Specifies a United States Postal Service (USPS) Four-State bar code. This parameter may be abbreviated as US4ST. This bar code is also known as the Intelligent Mail Bar Code.

The USPS Four-State bar code symbol has a fixed size; therefore the **HEIGHT** and **RATIO** parameters are not applicable and ignored. This bar code symbol allows a **MODWIDTH** parameter with two sizes **SMALL** and **OPTIMAL**. If you specify any other **MODWIDTH**, PPFA issues a warning message (RC=4), defaults to **OPTIMAL**, and continues generating the page definition. **MODWIDTH SMALL** prints a symbol approximately 2.575 inches wide and **MODWIDTH OPTIMAL** prints a symbol approximately 2.9 inches wide.

The input data is all numeric and consists of 5 data fields. The first 4 are fixed length; the fifth is variable length. The 5 fields are:

1. Application ID (2 digits): the second digit must be 0 to 4 so that the valid values are 00-04, 01-14, etc. thru 90-94.
2. Special Services (3 digits): assigned by the USPS; valid values are 000–999
3. Customer Identifier (6 digits): assigned by the USPS; valid values are 000000–999999
4. Sequence Number (9 digits): assigned by the mailer; valid values are 000000000–999999999
5. Delivery Point ZIP Code (0,5,9, or 11 digits): refer to the **MOD** parameter below for valid values.

USPS Four-State modifiers (**MOD**) are defined as follows:

X'00'

Present a USPS Four-State bar code symbol with no Delivery Point ZIP Code. The input data for this bar code symbol must be 20 numeric digits.

X'01'

Present a USPS Four-State bar code symbol with a 5-digit Delivery Point ZIP Code. The input data for this bar code symbol must be 25 numeric digits. The valid values for the Delivery Point ZIP code are 00000-99999.

X'02'

Present a USPS Four-State bar code symbol with a 9-digit Delivery Point ZIP Code. The input data for this bar code symbol must be 29 numeric digits. The valid values for the Delivery Point ZIP code are 000000000-999999999.

X'03'

Present a USPS Four-State bar code symbol with a 11-digit Delivery Point ZIP Code. The input data for this bar code symbol must be 31 numeric digits. The valid values for the Delivery Point ZIP code are 00000000000-99999999999.

Note

You can print HRI with this symbol but it is not currently (Oct 2004) defined by the USPS. Consequently, PPFA defaults the **HRI** parameter to **HRI OFF** for this symbol. The USPS has said that in the future they plan to define HRI for some Special Services. "Track and Confirm" is an example of a Special Service that USPS does not currently define HRI but might in the future.

REDTAG (same as **35**)

Specifies a 4-state bar code type defined by the Royal Mail Postal Service of England as RED TAG.

DATABAR (same as **36**)

Specifies a bar code type of GS1 DataBar.

Common BARCODE Parameters

```

MOD n
[HRI {ON | ABOVE | BELOW | OFF | ONLY} [HRIFONT fontname]]
[SSASTERISK {ON | OFF}]
[WIDTH n {IN | MM | CM | POINTS | PELS}]
[HEIGHT n {IN | MM | CM | POINTS | PELS}]
[MODWIDTH {n | OPTIMAL | SMALL}]
[BCCOLOR colorname | RGB rvalue gvalue bvalue |
  HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
  CMYK cvalue mvalue yvalue kvalue |
  CIELAB lvalue (-) c1value (-) c2value]]
[SUPPBLANKS]
[RATIO n]
[CMR cmr-1name {AUDIT | INSTR | LINK}]...

```

MOD

MOD *n*

Specifies additional processing information about the bar code symbol to be generated. For example, for some bar code types **MOD** specifies whether a check-digit should be generated for the bar code symbol.

Note

Check digits are a method of verifying data integrity during the bar code reading process.

n

The meaning of *n* differs between bar code types. For more information, see information on **MOD** parameter in *Bar Code Object Content Architecture (BCOCA) Reference (S544-3766)*.

If **MOD** is not specified, the **MOD** value defaults as follows, depending on the bar code type specified:

TYPE	MOD	TYPE	MOD
1	1	22	0
2	1	23	0
3	0	24	0
5	0	26	0
6	0	27	0
7	0	28	0
8	0	29	0
9	0	30	0
10	1	31	1
11	1	32	2

TYPE	MOD	TYPE	MOD
12	1	33	0
13	1	35	1
17	2	36	0

HRI

```
HRI {ON | ABOVE | BELOW | OFF | ONLY} [HRIFONT fontname]
```

Specifies the human-readable interpretation (text characters) to be generated and placed above or below the bar code symbol, as directed.

ON

Specifies that **HRI** should be generated at the default location for the barcode type.

ABOVE

Specifies that **HRI** should be placed above the bar code symbol.

BELOW

Specifies that **HRI** should be placed below the bar code symbol.

OFF

Specifies that **HRI** should not be generated.

ONLY

Specifies that only the **HRI** is to be printed. No barcode symbol is to be generated. The **POSITION** parameters on the **FIELD** command specify the placement position for the first character of the **HRI**.

 **Note**

1. Not all barcode printers honor the request to suppress printing the barcode symbol.
2. If **HRI** is requested, and **HRI** font isn't, the printer default font is used to render the **HRI**, instead of the font specified on the **FIELD FONT** subcommand.
3. **HRI** is not supported by any of the 2D bar codes.

HRIFONT *fontname*

Specifies the local name of a font used in printing the **HRI** for the barcode. This font must first be defined in a previous font command in the page definition.

SSASTERISK

```
SSASTERISK {ON | OFF}
```

Specifies whether an asterisk is to be generated as the **HRI** for **CODE39** bar code start and stop characters.

↓ Note

SSASTERISK is ignored by all bar code types except **CODE39**.

ON

Specifies that start and stop characters should be generated in the **HRI**.

OFF

Specifies that start and stop characters should not be generated in the **HRI**.

WIDTH

WIDTH *n* [**IN** | **MM** | **CM** | **POINTS** | **PELS**]

Specifies the width of the whole bar code symbol.

n

Specifies the width value of the whole bar code symbol. The *n* value can be up to 3 decimal places.

HEIGHT

HEIGHT *n* [**IN** | **MM** | **CM** | **POINTS** | **PELS**]

Specifies the height of bar code element. For UPC and EAN bar codes, the total height includes the bar code and the **HRI** characters.

If **HEIGHT** is not specified, the printer default height is used.

↓ Note

HEIGHT is ignored by bar code types that explicitly specify the element heights (for example, **POSTNET** or **RM4SCC**).

n

Specifies the height of the bar code. The *n* value can be up to 3 decimal places.

unit

Specifies a unit of measurement for the **HEIGHT** parameter. The choices are **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

↓ Note

1. If no unit is specified, the default is the most recent **SETUNITS**, p. 425 command value or **IN** (inch) if a **SETUNITS** command has not been issued.
2. Height for the 2D barcode PDF417 specifies the height of a bar or row (not the total height of the symbol).

MODWIDTH

MODWIDTH { *n* | **OPTIMAL** | **SMALL** }

Specifies the width of the smallest defined bar code element, using mils (thousandths of an inch). The range of values allowed is 1-254. If **MODWIDTH** is not specified, the printer default **MODWIDTH** is used; the printer default yields the optimum scannable symbol.

n

Specifies the width of each module, using thousandths of an inch (1/1000) as the unit of measurement.

OPTIMAL

Specifies that the printer chooses the optimal module width. This value is recommended. It is the default value when **MODWIDTH** is not coded.

SMALL

Specifies that the PPFA chooses a module width that produces the smallest symbol that meets the symbology tolerances.

Note

Because this symbol is at the lower boundary of the symbology-defined tolerance range, external conditions such as printer contrast setting, toner consistency, paper absorbency, and so forth, might cause this symbol to scan improperly.

Code Examples

```
PAGEDEF 4SXM1  REPLACE YES;
FONT FN1;

PRINTLINE ;
FIELD START 1  LENGTH 20 BARCODE BC1 TYPE US4ST;

PRINTLINE ;
FIELD START 21 LENGTH 20 BARCODE bc2 TYPE US4STATE MOD 0
MODWIDTH OPTIMAL;
PRINTLINE ;
FIELD START 41 LENGTH 25 BARCODE bc3 TYPE US4STATE MOD 1
MODWIDTH SMALL ;
PRINTLINE ;
FIELD START 66 LENGTH 29 BARCODE bc4 TYPE US4STATE MOD 2
MODWIDTH SMALL ;
PRINTLINE ;
FIELD START 66 LENGTH 31 BARCODE bc5 TYPE US4STATE MOD 3
MODWIDTH SMALL ;
PRINTLINE ;
FIELD START 66 LENGTH 31 BARCODE bc6 TYPE US4STATE MOD 3
MODWIDTH 15 ;
```

In the previous example:

- There are **FIELD BARCODE** commands for the new “Four State” bar code with default Modifier, and explicit Modifiers each with the proper field length.
- There are **FIELD BARCODE** commands using the new **MODWIDTH** parameters **SMALL** and **OPTIMAL**.
- One **BARCODE** command uses an explicit **MODWIDTH** parameter, which should result in an informational message and a **MODWIDTH** of **OPTIMAL**.

Color Parameters

```
[BCCOLOR colorname | RGB rvalue gvalue bvalue |
HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
CMYK cvalue mvalue yvalue kvalue |
CIELAB lvalue (-) c1value (-) c2value]
```

These parameters specify a color to be used in printing the barcode and its HRI. Defined colors are specified with the **DEFINE COLOR** command.

BCCOLOR *colorname*

Specifies an **OCA** color or a defined color to be used in printing the barcode and its HRI. Defined colors are specified with the **DEFINE COLOR** command.

Values for color names are:

- A defined color (defined by the **DEFINE COLOR** command)
- **NONE**
- **DEFAULT**
- **BLACK**
- **BLUE**
- **BROWN**
- **GREEN**
- **PINK**
- **RED**
- **TURQ** (turquoise)
- **YELLOW**
- **ORANGE**
- **PURPLE**
- **MUSTARD**
- **GRAY**
- **DARKBLUE**
- **DARKGREEN**
- **DARKTURQ** (dark turquoise)

The color choices depend on the printer. **NONE** is the color of the medium. **DEFAULT** is the printer default color.

Color-Model Parameters

```
[RGB rvalue gvalue bvalue |
  HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
  CMYK cvalue mvalue yvalue kvalue |
  CIELAB lvalue (-) c1value (-) c2value]
```

These parameters specify the color of print for this field supported in MODCA for the Red/Green/Blue color model (RGB), the highlight color space, the Cyan/Magenta/Yellow/Black color model (CMYK), and the CIELAB color model.

Figure [Bar Code Color Examples, p. 334](#) shows 4 bar codes that use color.

1. The first uses a predefined non-OCA color.
2. The second uses an OCA color that is not predefined.
3. The third uses a predefined OCA color.
4. The fourth uses a CMYK color model directly.

Bar Code Color Examples

```

/*-----*/
/* CMRX13 - Full Color on Bar Code */
/* */
/* */

SUPPBLANKS

SUPPBLANKS

Suppress the trailing blanks in the data field used to generate the barcode.

When the page definition selects any of the EAN, UPC or Postnet bar code types and modifiers and have also requested that trailing blanks be truncated for the bar code field, the print server examines the resulting data length and choose the correct bar code type and modifier for the bar code object created.

Note

If the data length does not match any of the bar code type and modifier combinations, the print server uses the original bar code type and modifier requested to build the bar code object.

RATIO

RATIO *n*

Specifies the ratio between the width of the wide and the narrow bar code elements. The range of values allowed is 100-500, but you must specify a value appropriate for your printer and bar code type or you will get errors at print time.

If **RATIO** is not specified, the printer default ratio is used.

n

The **RATIO** is specified as a percent value. For example, 200 represents a ratio of 2 to 1; 250 represents a ratio of 2.5 to 1. For most bar code symbols, the **RATIO** value should be between 200 and 300. For bar code types that explicitly specify the module width (for

example, **POSTNET** and **RM4SCC**, this field is ignored. If **RATIO** is not specified, the default ratio for the bar code symbol is used.

CMR

```
[CMR cmr-lname {AUDIT | INSTR | LINK}]...
```

Note

See [AFP Color Management, p. 164](#) for more information about using the CMR subcommand.

Specify a Color management resource (CMR) and its process mode for a bar code object within the page definition.

cmr-lname

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

Note

This parameter must immediately follow the **CMR** keyword.

processing mode parameter

Specifies the processing mode for the CMR.

AUDIT

Process this CMR as an audit CMR.

INSTR

Process this CMR as an instruction CMR.

LINK

Process this CMR as a link CMR. This processing mode is only valid for device link (DL) CMRs.

In Figure [Examples of Bar Codes with CMRs, p. 336](#), two bar codes are defined with CMRs specified. The bar codes are defined for traditional, record format and XML page definitions.

Note

The **DEFINE CMRNAME** commands for `mycmr` and `dark1` are used in each page definition but defined only once. Page definitions that are compiled together can only define a local CMR name once. This is because a **DEFINE CMRNAME** definition is global for all page definitions and form definitions in the same set of source code.

Examples of Bar Codes with CMRs

```
DEFINE mycmr  CMRNAME ... ;
DEFINE dark1  CMRNAME ... ;

/* Traditional Pagedef          */
PAGEDEF cmr10P  REPLACE yes;
PRINTLINE;
  FIELD Start 1 Length 20
  BARCODE TYPE code39 MOD 1
  CMR myCMR  audit;
  FIELD Start 21 Length 40
```

```

        BARCODE TYPE code39 MOD 1

        CMR dark1 instr;

```

Common 2D BARCODE Parameters

```

BCXPARMS {ESC | NOESC}
[NOE2A | E2A {CP500 | CP290 | CP1027 | CV1390To943 |
CV1399To943 | CV1390To942 | CV1399To942 | CV1390To932 | CV1399To932}]
[Data Matrix 2D Parameters | MaxiCode 2D Parameters |
PDF417 2D Parameters | QRCODE 2D Parameters]

```

These barcode parameters are common for all for two-dimensional barcode types.

Note

See the *Bar Code Object Content Architecture (BCOCA) Reference*, S544-3766 and [More About Bar Code Parameters](#), p. 452 for more details on these parameters.

BCXPARMS

```
BCXPARMS {ESC | NOESC}
```

Specifies whether or not to process escape sequences in the data.

Note

If the EBCDIC to ASCII flag is set (**E2A**), all characters are converted ASCII first so that the EBCDIC backslash characters (X'E0') are converted to ASCII (X'5C') before the escape sequence handling is applied.

ESC

Escape Sequence Handling. This is the default value. When this parameter is coded or defaulted, each backslash character within the barcode data is treated as an escape character according to the particular barcode symbology specification.

NOESC

Ignore Escape Sequences. When this parameter is coded, each backslash character within the bar code data is treated as a normal data character. Note that in this case no code page switching can occur within the data.

EBCDIC to ASCII translation parameter

```
{NOE2A | E2A {CP500 | CP290 | CP1027 | CV1390To943 |
CV1399To943 | CV1390To942 | CV1399To942 | CV1390To932 | CV1399To932}}
```

Determines whether or not to translate the data.

Note

Only QR CODE uses the **E2A** code page parameters.

NOE2A

No translation. This is the default value. This parameter is used for all two-dimensional barcodes. No translation is done by the printer or PPFA. The barcode data is assumed to be the default coding as defined in the AIM Uniform Symbology Specification.

E2A

EBCDIC to ASCII translation for all two-dimensional barcodes.

- For Data Matrix and MaxiCode the printer converts each byte of the data from EBCDIC codepage 500 to ASCII codepage 819.
- For PDF417 the printer converts each byte of the barcode data and each byte of the Macro PDF417 control block data from a subset of EBCDIC codepage 500 into ASCII. This translation covers 181 code points which includes alphanumerics and many symbols. The code points that are **not** covered by the translation do not occur in EBCDIC and are mapped, by the printer, to the X'7F' (127) code point. **Do not use the following EBCDIC code points for PDF417:**

EBCDIC Code Points not used with the E2A Command

X'04'	X'06'	X'08'	X'09'	X'0A'	X'14'	X'15'	X'17'
X'1A'	X'1B'	X'20'	X'21'	X'22'	X'23'	X'24'	X'28'
X'29'	X'2A'	X'2B'	X'2C'	X'30'	X'31'	X'33'	X'34'
X'35'	X'36'	X'38'	X'39'	X'3A'	X'3B'	X'3E'	X'46'
X'62'	X'64'	X'65'	X'66'	X'6A'	X'6B'	X'6C'	X'6D'
X'6E'	X'6F'	X'70'	X'72'	X'73'	X'74'	X'75'	X'76'
X'77'	X'78'	X'80'	X'8C'	X'8D'	X'8E'	X'9D'	X'9F'
X'AC'	X'AD'	X'AE'	X'AF'	X'B4'	X'B5'	X'B6'	X'B9'
X'BC'	X'BD'	X'BE'	X'BF'	X'CA'	X'CF'	X'DA'	X'EB'
X'ED'	X'EE'	X'EF'	X'FA'	X'FB'	X'FD'	X'FE'	X'FF'

 **Note**

If you choose this option, have PDF417 Macro data, and are running on an ASCII platform (Windows NT, or Windows 2000), your PDF417 Macro data is already in ASCII, but the **E2A** command signals the printer to convert the data. A problem occurs because the PDF417 Macro data you code is ASCII, the line data is EBCDIC, and the printer cannot tell the difference. To avoid this problem, PPFA converts the macro data to EBCDIC codepage 500 by treating the ASCII platform as codepage 819. If any of the data code points map to the code points in Table [EBCDIC Code Points not used with the E2A Command, p. 338](#) PPFA issues an error message and does not generate a page definition. **Do not use the code points in Table [ASCII Code Points not used with the E2A Command, p. 339](#) when coding a PDF417 Macro and generating a page definition on an ASCII platform while translating the data from EBCDIC to ASCII (E2A):**

ASCII Code Points not used with the E2A Command

X'80'	X'81'	X'82'	X'83'	X'84'	X'85'	X'86'	X'87'
X'88'	X'89'	X'8A'	X'8B'	X'8C'	X'8D'	X'8E'	X'8F'
X'90'	X'91'	X'92'	X'93'	X'94'	X'95'	X'96'	X'97'
X'98'	X'99'	X'9A'	X'9B'	X'9C'	X'9D'	X'9E'	X'A4'
X'A6'	X'A7'	X'A8'	X'A9'	X'AE'	X'AF'	X'B4'	X'B6'
X'B8'	X'BE'	X'CO'	X'C1'	X'C2'	X'C3'	X'C8'	X'CA'
X'CB'	X'CC'	X'CD'	X'CE'	X'CF'	X'D0'	X'D7'	X'D8'
X'DD'	X'DE'	X'E3'	X'FO'	X'F8'	X'FD'	X'FE'	

- QRCODE - The default coding for QRCODE is ECI 000020 which is equivalent to the IBM ASCII code page 897. When translation is required, you must enter the code page to use for translation. There are 3 choices. Each choice causes the printer to translate from the code page into ASCII code page 897 before the data is used to build the barcode symbol:
 - EBCDIC code page 500 (International #5). Only 128 bytes of this code page can be translated into ECI 000020. These code points are specified in *Bar Code Object Content Architecture (BCOCA) Reference (S544-3766)*.
 - EBCDIC code page 290 (Japanese Katakana Extended).
 - EBCDIC code page 1027 (Japanese Latin Extended).

Values that begin with **CP** are used when the input data is encoded with a single-byte EBCDIC code page. The parameter identifies the EBCDIC code page that encodes single-byte EBCDIC bar code data:

CP500

Code page 500 (International #5) Only 128 of the characters within ECI 000020 can be specified in code page 500. The code page 500 characters that can be translated are shown in the *Bar Code Object Content Architecture Reference, S544-3766*.

CP290

Code page 290 (Japanese Katakana Extended)

CP1027

Code page 1027 (Japanese Latin Extended)

Values that begin with **CV** are used when the input data is SOSI. Each parameter identifies a specific conversion from EBCDIC SOSI input data to a specific mixed-byte ASCII encoding:

CV1390To943

Translates EBCDIC data CCSID 1390 code points to ASCII Shift-JIS CCSID 943 code points.

CV1399To943

Translates EBCDIC data CCSID 1399 code points to ASCII Shift-JIS CCSID 943 code points.

CV1390To932

Translates EBCDIC data CCSID 1390 code points to ASCII Shift-JIS CCSID 932 code points.

CV1399To932

Translates EBCDIC data CCSID 1399 code points to ASCII Shift-JIS CCSID 932 code points.

CV1390To942

Translates EBCDIC data CCSID 1390 code points to ASCII Shift-JIS CCSID 942 code points.

CV1399To942

Translates EBCDIC data CCSID 1399 code points to ASCII Shift-JIS CCSID 942 code points.

Note

CCSID definitions:

CCSID 932

Japanese PC Data Mixed including 1880 UDC.

CCSID 942

Japanese PC Data Mixed including 1880 UDC, Extended SBCS.

CCSID 943

Japanese PC Data Mixed for Open environment (Multi-vendor code): 6878 JIS X 0208-1990 chars, 386 IBM selected DBCS chars, 1880 UDC (X'F040' to X'F9FC')

CCSID 1390

Extended Japanese Katakana-Kanji Host Mixed for JIS X0213 including 6205 UDC, Extended SBCS (includes SBCS and DBCS euro)

CCSID 1399

Extended Japanese Latin-Kanji Host Mixed for JIS X0213 including 6205 UDC, Extended SBCS (includes SBCS and DBCS euro)

Concatenated BARCODE Parameters

BCDSYMB { *symname* | **BCDSEQ** *seq#* | **BCDNEW**

BCDSYMB

Specifies the bar code data collection symbol and names a bar code data collection. All bar code data described with the **FIELD** command and bar codes with this name will be collected for printing the bar code.

symname

Defines an alphanumeric name up to 16 characters long. This name must be unique within a page format.

BCDSEQ *seq#*

Specifies a bar code data sequence number. This value allows for sequencing bar code data. Bar code data collected with unique sequence numbers will be collected in ascending order of sequence number. Data with the same sequence number will be collected in the order that their **FIELD** commands are processed.

↓ Note

BCDSEQ is optional; but if it coded, all bar codes with the same **BCDSYMB** symbol name must code **BCDSEQ**.

BCDNEW

Specifies to start a new bar code symbol for collected bar code data when this record is reused.

If **BCDSEQ** is used to sequence the collection data, **BCDNEW** is placed on the **FIELD** command for the first record encountered in the data. This record might not be the first sequentially. In general, **BCDNEW** is placed on the record for the first piece of data encountered in the bar code data collection. If **BCDSYMB** is not specified, **BCDNEW** will be ignored.

↓ Note

This parameter has no effect on a **PRINTLINE FIELD BARCODE** command because the **BCDNEW** function does not apply to traditional line data.

DataMatrix 2D Parameters

[**SIZE** *rows* [**BY**] *cols*]
 [**SEQUENCE** *seq* [**OF**] *tot* [**ID** {1 1 | *uidHi uidLo*}]
 [**USERDEF** | **FNC1UCC** | **FN1IND** | **RDRPROG** | **MAC5** | **MAC6** | **ENCODE** *type*]

SIZE

SIZE *rows* [**BY**] *cols*

Specifies the size of the two-dimensional barcode. If **SIZE** is not coded, the size is marked as unspecified and the appropriate number of rows and columns are used based on the amount of data being presented.

rows [**BY**] *cols*

Specifies The desired number of rows, including the finder pattern, and the desired number of columns (or modules) in each row including the finder pattern. The keyword **BY** is

optional. The rows and columns must be one of the allowed combinations in *Bar Code Object Content Architecture Reference*, Data Matrix Special-Function Parameters.

SEQUENCE

SEQUENCE *seq* [OF] *tot* [ID {1 1 | *uidHi uidLo*}

Structured append sequence indicator. Some two-dimensional barcodes can be logically linked together to encode large amounts of data. The logically linked symbols can be presented on the same or different media and are logically recombined after they are scanned. PPFA checks the numbers for obvious errors as well as the proper number range. For example, **SEQUENCE 5 OF 3** is obviously wrong.

seq

The number within the sequence. This parameter is an integer whose acceptable range of values is dependent on the barcode type. The range for this parameter is 1 to 16.

OF

Optional parameter for readability.

tot

Total number of structured-append symbols. This parameter is an integer whose acceptable range of values is dependent on the barcode type. The range of this parameter is 2 to 16.

ID

ID {1 1 | *uidHi uidLo*}

The high and low order bytes of a unique file identification for a set of structured-append symbols. Each is a unique number between 1 and 254 and identifies this set of symbols. The actual File ID is computed by 256 times *uidHi* plus *uidLo*.

Special Functions

[**USERDEF** | **FNC1UCC** | **FN1IND** | **RDRPROG** | **MAC5** | **MAC6** | **ENCODE** *type*]

These parameters specify special functions which can only be used with a Data Matrix symbol.

USERDEF

User-defined data symbol with no header or trailer instructions to the reader.

FNC1UCC

UCC/EAN FNC1 alternate data type identifier. A FNC1 is added in the first data position (or fifth position of a structured append symbol) to indicate that this bar code symbol conforms to the UCC/EAN application identifier standard format.

FN1IND

Industry FNC1 alternate data type identifier. An FNC1 is added in the second data position (or sixth data position of a structured append symbol) to indicate that this bar code symbol conforms to a particular industry standard format.

RDRPROG

Use this when the symbol contains a message used to program the barcode reader. In this case the barcode symbol cannot be a part of a structured append sequence.

MAC5

This provides instructions to the bar code reader to insert an industry specific header and trailer around the symbol data. The bar code symbol contains a 05 Macro code word. The barcode symbol cannot be a part of a structured append sequence.

MAC6

Same as **MAC5**, except that the bar code symbol contains a 06 Macro code word. The barcode symbol cannot be a part of a structured append sequence.

ENCODE

Data Matrix bar code encoding scheme.

type

Specifies the Data Matrix bar code encoding scheme. These encoding schemes are supported:

DEFAULT

This uses a device-specific method of selecting and switching among encoding schemes. If you are unsure of which encoding scheme to use, device default is a good choice.

ASCII

This encoding scheme produces 4 bits per data character for double digit numerics, 8 bits per data character for ASCII values 0–127, and 16 bits per data character for Extended ASCII values 128–255.

C40

This encoding scheme is used when the input data is primarily upper-case alphanumeric.

Text

This encoding scheme is used when the input data is primarily lower-case alphanumeric.

X12

This encoding scheme is used when the input data is defined with the ANSI X12 EDI data set.

EDIFACT

This encoding scheme is used when the input data is ASCII values 32–94.

BASE256

This encoding scheme is used when the data is binary (for example image or non-text data).

AUTO

Starts with ASCII encoding and switches between encoding schemes as needed to produce the minimum symbol data characters.

MaxiCode 2D Parameters

[MODE {4 | md}]

```
[SEQUENCE seq [OF] tot]
[NOZIPPER | ZIPPER]
```

MODE

```
MODE {4 | md}}
```

Symbol mode (used for MaxiCode two-dimensional barcode only). If not coded, the default is Standard Symbol Mode 4.

2

Structured Carrier Message — numeric postal code

3

Structured Carrier Message — alphanumeric postal code

4

Standard symbol (default)

5

Not supported

6

The bar code data is used to program the bar code reader system.

SEQUENCE

```
SEQUENCE seq [OF] tot
```

Structured append sequence indicator. Some two-dimensional barcodes can be logically linked together to encode large amounts of data. The logically linked symbols can be presented on the same or different media and are logically recombined after they are scanned. PPFA checks the numbers for obvious errors as well as the proper number range. For example, **SEQUENCE 5 OF 3** is obviously wrong.

seq

Number within the sequence. This parameter is an integer whose acceptable range of values is dependent on the barcode type. The range of this parameter is 1 to 8.

OF

Optional parameter for readability.

tot

Total number of structured-append symbols. This parameter is an integer whose acceptable range of values is dependent on the barcode type. The range for this parameter is 2 to 8.

ZIPPER

```
[NOZIPPER | ZIPPER]
```

Specifies whether to print a zipper pattern and contrast block. This parameter is used for MaxiCode two-dimensional barcodes only.

NOZIPPER

Do not print a zipper pattern.

ZIPPER

Print a zipper pattern.

PDF417 2D Parameters

```
[SIZE {MIN | rows} [BY] {10 | cols}]
[SECLEV {0 | s1}]
[MACRO 'qstring'...]
```

SIZE

```
[SIZE {MIN | rows} [BY] {10 | cols}]
```

Specifies the size of the two-dimensional barcode.

MIN

Instructs the printer to use the minimum number of rows necessary to print the symbol. This is the default value.

rows

The desired number of rows. The allowable values are 3 to 90.

BY

Optional parameter for readability.

cols

The desired number of columns (data symbol characters in a row). The allowable values are 1 to 30. The default value is **10**.

The *rows* and *cols* values do not include the start patterns or left and right row indicators. The product of *rows* and *cols* cannot exceed 928.

SECLEV

```
SECLEV {0 | s1}
```

This parameter specifies the desired security level for the symbol as a value from **0** to **8**. Each higher security level causes more error correction codewords to be added to the symbol. If not coded, the default is security level **0**.

MACRO

```
MACRO 'qstring'...
```

Specifies PDF417 Macro data.

The total length of macro text is limited to 28,000 bytes. This limit is imposed by the data stream architecture. The total number of bytes allowed in a structured field is 32,000. Macro data has to be shared with triplets, barcode data (which can be up to 2710 bytes), and other overhead.

qstring

A quoted string. The string does not extend across records, but you can code multiple quoted strings. Code the **MACRO** keyword only once.

QR CODE 2D Parameters

```
[SIZE {MIN | rows}]
[SEQUENCE seq [OF] tot [PARITY X'dd']]
```

```
[ECLEV {L | M | Q | H}]
[USERDEF | FNC1UCC | FNC1IND AI 'ai']]
```

SIZE

```
SIZE {MIN | rows}
```

The desired size (in rows and columns of the QR CODE barcode. This symbol is square so both rows and columns will be the same.

MIN

Instructs the printer to use the minimum number of rows necessary to print the symbol.

rows

The desired number of rows and columns. The allowable values are from 21 to 177 increments of 4. These are also specified in *Bar Code Object Content Architecture Reference*, QR Code Special-Function Parameters.

SEQUENCE

```
SEQUENCE seq [OF] tot [PARITY X'dd']
```

QR barcodes can be logically linked together to encode large amounts of data. The logically linked symbols can be presented on the same or different media and are logically recombined after they are scanned. PPFA checks the numbers for obvious errors as well as the proper number range. For example, **SEQUENCE 5 OF 3** is obviously wrong.

seq

The number within the sequence. This parameter is an integer whose acceptable range of values is 1 to 16.

OF

Optional parameter for readability.

tot

Total number of structured-append sequences indicator. This parameter is an integer whose acceptable range of values is 2 to 16.

PARITY X'dd'

Structured append parity data. This parameter is used for the QR Code 2D barcode only when it has linked structured-append symbols. The parameter specifies the parity byte for the entire collection of linked structured-append symbols. The parity byte is the same for each symbol in the collection and is obtained by doing an "exclusive or" function on all of the bytes of the ASCII data in all symbols of the collection. If this symbol is not structured-append symbol, the parity parameter is ignored.

X'dd'

The parity data byte. It must be entered as two hexadecimal digits (X'0'–X'F'). As for all hexadecimal digits in PPFA, X'A'–X'F' must be uppercase.

ECLEV

```
ECLEV {L | M | Q | H}
```

Specifies the level of error correction to be used for the symbol. Each higher level of error correction causes more error correction code words to be added to the symbol and therefore leaves fewer

code words for the data. Refer to the particular barcode symbology specification for more information. Four different levels of Reed-Solomon error correction can be selected:

L

Level **L** allows recovery of 7% of symbol code words.

M

Level **M** allows recovery of 15% of symbol code words.

Q

Level **Q** allows recovery of 25% of symbol code words.

H

Level **H** allows recovery of 30% of symbol code words.

Special Functions

```
[USERDEF | FNC1UCC | FNC1IND AI 'ai' ]
```

These parameters specify special functions which can be used with QR Code 2D symbols.

USERDEF

This is a user-defined symbol with either no significance or “user-defined” significance assigned to all FNC1 characters appearing in the symbol. This is the default value.

FNC1UCC

UCC/EAN FNC1 alternate data type identifier. The symbol indicates that this QR Code symbol conforms to the UCC/EAN application identifiers standard.

FNC1IND

Industry FNC1 alternate data type identifier. The symbol indicates that this QR Code symbol conforms to the specific industry or application specifications previously agreed with AIM International. When this standard is selected, an application indicator must be specified.

AI 'ai'

Application indicator for Industry FNC1. This is coded as a single upper or lower case alphabetic character, or a 2-digit number. It must be enclosed in single quotes. This parameter is required for QR Code barcodes when **FNC1IND** is coded.

FONT Command

```
FONT {[name] cfname | lname {'cfname' |
  CS character-set-name CP code-page-name |
  GRID hex-grid}}
[SBCS | DBCS]
[HEIGHT n [POINTS | IN | CM | MM | PELS]]
[TYPE [RATIO percent]]
[ROTATION [0 | 90 | 180 | 270]]
[[RESOLUTION | RES] {240 | 300}
  [[METRICTECHNOLOGY | METTECH] {FIXED | RELATIVE}]] ;
```

TYPE (Traditional and Record Format)

```
[TYPE {EBCDIC | ASCII | UNICODE}]
```

TYPE (XML)

```
TYPE {EBCDIC | ASCII | UNICODE}
```

The **FONT** command is used to identify the fonts that are to be specified with the following commands:

- **Traditional:** **PRINTLINE**, **FIELD**, and **TRCREF** commands
- **Record Layout:** **LAYOUT** and **FIELD** commands
- **XML:** **XLAYOUT** and **FIELD** commands

A maximum of 127 font names for each page definition can be identified.

Note

Naming a font with the **FONT** command does not, by itself, affect your output. You must specify the font in one of the commands listed above for the font to become effective. You must name at least one font in a Record Format or XML page definition.

FONT commands immediately follow the **PAGEDEF** command. A separate **FONT** command is required:

- For each font used within a page definition
- For each rotation of the same font

Note

For a Traditional exception, see the [TRCREF command, p. 427](#).

FONT

```
FONT {[lname] cname | lname {'cname' |  
CS character-set-name CP code-page -name |  
GRID hex-grid}}
```

Identifies the fonts to be specified in the commands listed above.

lname

Local name for the font. Specifies an unquoted alphanumeric name of 1 to 16 characters (local name) of the font to be used in this page definition. The name must conform to the token rules and must be unique within this page definition.

lname is optional if *cname* is specified.

cname

Coded font name. Specifies an alphanumeric name of 1 to 6 characters (user-access name) of the coded font to be used in this page definition. Specify this name without the *Xn* prefix.

'*cname*'

Quoted full user-access name. Specifies a quoted alphanumeric name of 1 to 8 characters of the coded font to be used in this page definition. The name can contain blanks and special characters. No upper case folding or prefix is added to the name. The '*cname*' variable is intended for outline fonts and allows them to be selected without overriding the

HEIGHT specified in the CFI structured field in the coded font. Enter the full outline font name as a quoted name and do not enter the **HEIGHT** parameter. For example, if you enter:

```
FONT myfont 'XZM32F'
```

the outline font XZM32F is used with no overriding **HEIGHT** parameters.

↓ Note

1. The quoted name of the font name is primarily intended for outline fonts. If you use a quoted name for a raster font, you must be sure that you have the name corresponding to the correct rotation of the font.
2. If you use the quoted name of the font name, you must also enter an *Iname* (local name); sometimes called an "alias name".
3. You can still specify the **HEIGHT** command if you want to override the coded font height.

CS *character-set-name*

Specifies an alphanumeric name of 1 to 6 characters of the character set to be used in this page definition. Specify this name without the *Cn* prefix.

CP *code-page-name*

Specifies an alphanumeric name of 1 to 6 characters of the code page without the T1 prefix to be used in this page definition.

GRID *hex-grid*

Specifies the 16-character hexadecimal GRID.

3

Subcommands

SBCS or **DBCS** Subcommand

```
SBCS | DBCS
```

Specifies single-byte or double-byte fonts.

SBCS

Specifies that the font is a single-byte character set. This is the default.

DBCS

Specifies that the font is a double-byte character set.

HEIGHT Subcommand

```
HEIGHT n [POINTS | IN | CM | MM | PELS]
```

Specifies the height of the outline font.

POINTS

Each point is equal to 1/72 of one inch. This is the default.

IN

Inches.

CM

Centimeters.

MM

Millimeters.

PELS

Pels in the current logical units per inch; for example, in 240ths of an inch.

TYPE Subcommand (Traditional and Record Format)

```
TYPE {EBCDIC | ASCII | UNICODE}
```

The **TYPE** subcommand indicates the type of font being used. This parameter is optional for fonts in a traditional or record-format page definition.

EBCDIC

This parameter is normally used for fonts on OS/390-based systems. This is the default.

ASCII

This parameter is normally used for fonts on workstation-based systems.

UNICODE

This parameter is used with Unicode fonts.

TYPE Subcommand (XML)

```
TYPE {EBCDIC | ASCII | UNICODE}
```

The **TYPE** subcommand indicates the type of font being used. This parameter is required for fonts in an XML page definition.

EBCDIC

This parameter is normally used for fonts on OS/390-based systems.

ASCII

This parameter is normally used for fonts on workstation-based systems.

UNICODE

This parameter is used with Unicode fonts (fixed two-byte **UNICODE** without surrogates).

 **Note**

TYPE indicates what type of font is being used, OS/390 or workstation, for the printing of **PRINTLINE**, **LAYOUT** or **XLAYOUT** commands. **UDTYPE** (on the **PAGEDEF**) is the user's data type (EBCDIC, ASCII, UTF8, UTF16) that is being placed with the font. The font **TYPE** and user data **UDTYPE** should match but certain combinations of **TYPE** and **UDTYPE** are permitted.

- Data is UTF-8 and Font is ASCII or UNICODE
- Data is UTF-16 and Font is UNICODE

Otherwise, message AKQ271E results.

RATIO Subcommand

RATIO *percent*

Specifies the ratio of scaling the width relative to the height in an outline font.

percent

Represents the percent of the “normal” width of the character that is printed. For example, specifying **RATIO 50** yields a font with characters half as wide as normal, and specifying **RATIO 200** yields a font with characters twice as wide (200% as wide) as normal. If **RATIO** is specified, you must also specify the **HEIGHT**.

ROTATION Subcommand**ROTATION** [0 | 90 | 180 | 270]

Specifies the rotation of characters in degrees. The specified value is relative to the inline direction of a printline or field. Valid rotations are **0°**, **90°**, **180°**, or **270°**; **0°** is the default.

RESOLUTION Subcommand**{RESOLUTION | RES} {240 | 300}**
[{METRICTECHNOLOGY | METTECH} {FIXED | RELATIVE}]

Specifies the resolution and metric technology of a font.

RESOLUTION or **RES**

The raster-pattern resolution units in pels per inch. Valid values are **240** and **300**.

METRICTECHNOLOGY or **METTECH**

The metric technology used for this raster font:

FIXED

Fixed-metric technology

RELATIVE

Relative-metric technology

Note

1. The **RESOLUTION** subcommand allows rigorous font specifications for use with font fidelity. See the font fidelity subcommand **FONTFID** on the **FORMDEF** command.
2. For a description of metric technologies, refer to:
 - *Intelligent Printer Data Stream Reference*, S544-3417
 - *Font Object Content Architecture Reference*, S544-3285

Example of PFA Support for Font Fidelity

```
FORMDEF xmp01
  FONTFID YES ;

PAGEDEF xmp01  replace yes ;
  FONT  xx2  res  240  mettech  fixed ;
  PRINTLINE font  xx2 ;
```

In Figure [Example of PFA Support for Font Fidelity, p. 351](#), the form definition xmp01 specifies font fidelity and the page definition specifies a font that has 240 pels per inch resolution and fixed-metric

technology. If a font with exactly those characteristics is not accessible by the printer, an error occurs and processing stops.

LAYOUT Command (Record Format)

```
LAYOUT {DEFAULT | [C | X | A | E | U8 | U16]} 'record ID'
[BODY
  [NOGROUP |
  GROUP] [XSPACE 0 | n {IN | MM | CM | POINTS | PELS}] |
  PAGEHEADER |
  PAGETRAILER |
  GRPHEADER [XSPACE 0 | n {IN | MM | CM | POINTS | PELS}]]]
[NEWPAGE]
[DELIMITER {C | X} 'bytes']
[PRINTDATA {YES | NO}]
[POSITION
  [{SAME | = } |
  LEFTMARGIN |
  horiz {IN | MM | CM | POINTS | PELS}]
  [RELATIVE [NEXT |
  {SAME | = } |
  {(-)} vert {IN | MM | CM | POINTS | PELS}] |
  [ABSOLUTE] TOPMARGIN |
  ABSOLUTE {(-)} vert {IN | MM | CM | POINTS | PELS}]]]
[DIRECTION {ACROSS | DOWN | BACK | UP}]
[ENDSPACE n {IN | MM | CM | POINTS | PELS}]
[COLOR colorname |
  RGB rvalue gvalue bvalue] |
  HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
  CMYK cvalue mvalue yvalue kvalue |
  CIELAB lvalue {(-)} c1value {(-)} c2value]
[FONT name1 [, name2]]
[OBJECT {lname [0 0 | relX relY] |
  VARIABLE VARIABLE Parameters [0 0 | relX relY]
  OBTYPE {PSEG | IOCA | BCOCA | GOCA | PTOCA |
  OTHER OBID {comp-id | typename}}]
  Other OBJECT Parameters]
[OVERLAY {name | VARIABLE VARIABLE Parameters}
  [0 0 | rel. x-pos rel. y-pos] OVROTATE {0 | 90 | 180 | 270}}]
[SEGMENT {name | VARIABLE VARIABLE Parameters}
  [0 0 | rel. x-pos rel. y-pos}}];
```

Variable Parameters

```
{[START n] LENGTH n |
  FLDNUM n [START n] [LENGTH n] |
  RECID [START n] [LENGTH n]}
```

Other OBJECT Parameters

```
[OBSIZE [USEOBJ | wd [unit] | hg [unit]]]
[OBMAP {LEFT | TRIM | FIT | CENTER | REPEAT | FILL}]
[OBCHPOS [USEOBJ | x-pos]]
[OBCVPOS [USEOBJ | y-pos]]
[OBROTATE {0 | 90 | 180 | 270}]
[OBCOLOR colorname]
[OBPAGE n]
[OBRESOLUTION x y {IN | CM}][OBCPSS PSS]
```

The **LAYOUT** command is used to format a data record. The **LAYOUT** command is associated with the line of data record using a record ID that appears both on the **LAYOUT** command and in the first *n* bytes of the data record. (Normally *n* is 10 bytes, but can be specified to be 1 to 250 bytes by using the **RECIDLEN** subcommand on either the **PAGEDEF** or **PAGEFORMAT** commands). The record ID is entered in quotes and must match the record ID within the data exactly, byte for byte. The ID is padded with blanks if the field is entered with less than *n* bytes.

The entire *record ID* should be specified on one single line in the **LAYOUT** command. It cannot be split into multiple lines. The number of characters on the input line, including the *record ID*, cannot exceed the logical record length of the input file limit.

The **LAYOUT** command is used in record format page definitions. It is analogous to the **PRINTLINE** and **XLAYOUT** commands in traditional page definitions and XML page definitions. You cannot mix the **LAYOUT** command with **PRINTLINE** or **XLAYOUT** commands.

Subcommands

DEFAULT Subcommand

```
{DEFAULT | [C | X | A | E | U8 | U16]} 'record ID'
```

The **DEFAULT** subcommand defines a default record ID that is used only when the layout type is either **PAGEHEADER** or **PAGETRAILER** and no name is needed.

C'*record ID*'

A quoted name with a C for Character that are treated the same as a quoted name up to 250 characters. No folding or translation is done.

A'*record ID*'

A quoted name with an A for ASCII entered with up to 250 single-byte characters that are accepted as-is if on an ASCII platform or translated to ASCII if on an EBCDIC platform. The translation is made with no case folding.

E'*record ID*'

A quoted name with an E for EBCDIC entered with up to 250 single-byte characters that are accepted as-is if on an EBCDIC platform or translated to EBCDIC if on an ASCII platform. The translation is made with no case folding.

X'*record ID*'

A quoted name with an X for Hexadecimal entered with up to 500 hexadecimal characters. The characters are translated to hexadecimal, but no assumption of data type will be made.

Note

The values of all X'00' and all X'FF's are considered reserved and should not be used to specify the hexadecimal name value.

U8'*record ID*'

A quoted name with a U8 for UTF-8 entered with up to 250 single-byte characters that are translated to UTF-8.

U16'*record ID*'

A quoted name with a U16 for UTF-16 entered with up to 125 single-byte characters that are translated to UTF-16.

BODY Subcommand

BODY

```
[NOGROUP |  
GROUP] [XSPACE 0 | n {IN | MM | CM | POINTS | PELS }] |  
PAGEHEADER |  
PAGETRAILER |  
GRPHEADER [XSPACE 0 | n {IN | MM | CM | POINTS | PELS}]
```

The **BODY** subcommand defines the default layout type that is used for the majority of data in the user's database, normally printed line by line.

NOGROUP

The **NOGROUP** parameter indicates that the active group header record should be discarded and not reprinted on subsequent pages.

GROUP

The **GROUP** parameter indicates that the existing group header should be saved and used for subsequent pages.

XSPACE

XSPACE indicates the amount of extra space from the position of the layout to the bottom of the group header area. This allows the user to identify the amount of extra space in excess of one text line being used by the header so that the baseline moves down and the following group data is not placed on top of the header area. This space is not calculated by PPFA and must be explicitly defined by the user.

PAGEHEADER

This layout type specifies a header that is to be printed on each new page. The baseline position of this layout is normally in the top margin, but can be anywhere on a logical page. If **RELATIVE** is specified, the position is considered to be relative to the page origin. Usually contains customer's name, address, account number, and so forth. Only one default **PAGEHEADER** layout can be specified in a **PAGEFORMAT** and no input record data can be specified in a default layout.

PAGETRAILER

This layout type specifies a trailer that is to be printed on each new page. The baseline position of this layout is normally in the bottom margin, but can be located anywhere on a logical page and can be specified as **RELATIVE**. Only one default **PAGETRAILER** layout can be specified in a **PAGEFORMAT** and no input record data is processed with a default layout. It may contain the name of the form or a footnote.

GRPHEADER

This layout type specifies a header that is to be printed at the beginning of a group of data. If a logical page eject occurs before the group of data ends, the header is printed after the top margin on each new page until the group ends. The baseline position of this layout can be specified as **RELATIVE**. It may include column headings.

XSPACE

XSPACE indicates the amount of extra space from the position of the layout to the bottom of the group header area. This allows the user to identify the amount of extra space in excess of one text line being used by the header so that the baseline moves down and the following group data is not placed on top of the header area. This space is not calculated by PPFA and must be explicitly defined by the user. See example below (shaded space shows group header area):

Example Showing the Use of XSPACE.

Checks	Check No.	Date	Amount
	352	01/04/90	\$ 321.50
	353	01/05/90	\$ 100.00
	354	01/10/90	\$ 122.30

Once a Group Header record is processed and is still active when leaving the **PAGEFORMAT**, the group header record is saved by the presentation services program. Whenever the same **PAGEFORMAT** is re-invoked, this saved group header record is presented again if the first body record after re-invoking the **PAGEFORMAT** selects a Body record that has the Group Indicator on.

NEWPAGE Subcommand

```
NEWPAGE
```

This parameter indicates that a new page should be started with this layout name. If this is a header or trailer layout, the print position is moved to the start of a new page before this header or trailer becomes the active header or trailer.

DELIMITER Subcommand

```
DELIMITER {C | X} 'bytes'
```

Defines a delimiting character within the customer's database that is used to separate fields. PPFA translates the character data to the data type specified by the **UDType** subcommand on the **PAGEDEF** command.

C

The delimiter is specified as character data.

X

The delimiter is specified as hexadecimal data. Hex characters must be entered in uppercase within the quotation marks and are not translated.

'bytes'

The one- or two-byte delimiter code.

Note

1. Delimiters specified after the Record ID are ignored.
2. You cannot mix delimited and non-delimited fields on the same **LAYOUT** command.

PRINTDATA Subcommand

```
PRINTDATA {YES | NO}
```

Specifies whether the line of data associated with the current **LAYOUT** should be printed. The **PRINTDATA** subcommand is useful when the data stream is interspersed with lines of comments, blank lines, or lines without data that are not meant to be printed.

YES

Specifies the data for the current **LAYOUT** is printed. **YES** is the default.

NO

Specifies the data for the current **LAYOUT**

POSITION Subcommand

```

POSITION
  [{SAME | =}] |
  LEFTMARGIN |
  horiz [IN | MM | CM | POINTS | PELS]]
  [RELATIVE | NEXT] |
  {SAME | = } |
  [(-)] vert [IN | MM | CM | POINTS | PELS]] |
  [ABSOLUTE] TOPMARGIN |
  ABSOLUTE [(-)] vert [IN | MM | CM | POINTS | PELS]]

```

The **POSITION** subcommand specifies the starting position of the layout in the printout. This is for use in positioning **FIELD**, **DRAWGRAPHIC**, and **ENDGRAPHIC** text and graphics. If **RELATIVE** is specified or **POSITION** is not specified, the baseline of the **POSITION** is relative to the previous **LAYOUT** position.

1. For **PAGEHEADER** RCD: The baseline position can be anywhere on a logical page, but cannot be specified as Relative.
2. For **PAGETRAILER**, **GROUPHEADER** and **BODY** RCDs: The baseline position can be anywhere on a logical page and can be specified as **RELATIVE**.

SAME

Specifies this line starts at the same horizontal offset position as the previously coded **LAYOUT**. If applied to the first **LAYOUT** of a logical page, the horizontal position is 0, which is the default.

=

Alternate for **SAME**.

horizontal position

x-pos

Specifies the horizontal offset from the left side of the logical page. The value is a number with up to three decimal places. The valid options for *x-pos* are described in the **SETUNITS** command for the horizontal value.

LEFTMARGIN

Specifies this line starts at the position specified as the horizontal (*x*) value in the previous **LEFTMARGIN** subcommand within this page definition.

RELATIVE

Specifies that the following vertical position value is to be processed as a relative value. The **LAYOUT** is positioned relative to the last **LAYOUT** placed on the page.

↓ Note

If both **TOP** and **RELATIVE** are requested for the *y-pos* value, the **RELATIVE** request is ignored.

When using **RELATIVE** positioning, PPFa does not flag off-the-page conditions for the position of a **LAYOUT** or for any overlays, segments or objects placed relative to that **LAYOUT**. **LAYOUT**s that fall outside the bounds of the logical page are flagged by the print server at run time.

When specifying **RELATIVE**, use the minus sign to indicate any negative values for the **LAYOUT** vertical position; you may use the plus sign to indicate positive values. If no sign is used, a positive value is assumed.

The **DIRECTION** for a relative **LAYOUT** must be **ACROSS**. Fields associated with a relative **LAYOUT** must have the same **DIRECTION** as the **LAYOUT** and must match the **PAGEFORMAT DIRECTION**.

If **RELATIVE** is specified with **SAME** or = as the *y* value, the relative value in the **LAYOUT** is +0.

RELATIVE positioning is allowed on a **LAYOUT** command only if the **LAYOUT** and all its associated **FIELD** commands are formatted to print in the same direction as the **PAGEFORMAT**. That is, the **DIRECTION** parameter in the **LAYOUT** and any associated **FIELD** commands must specify (or default to) **ACROSS**. The **DIRECTION** in the **PAGEFORMAT** or **PAGEDEF** command may be any allowable value: **ACROSS**, **DOWN**, **BACK**, or **UP**.

vertical position

y-pos

Specifies the vertical offset from the top side of the logical page. The value options for *y-pos* are described in the **SETUNITS** command for the vertical value.

TOPMARGIN

Specifies that the **LAYOUT** is placed in the position specified as the vertical (*y*) value in the **TOPMARGIN** subcommand within this page definition.

NEXT

Specifies the layout is to be positioned down (on the logical page) one line (as defined in the **LINESP** subcommand of the last **SETUNITS** command) from the previous **LAYOUT**. The **LINESP** subcommand of the **SETUNITS** command establishes the distance from one line to the next.

When **NEXT** is specified for the first **LAYOUT** of a logical page, the starting position of the line is one line down from the top of the logical page, as defined by the **TOPMARGIN** subcommand.

↓ Note

The “down” direction is determined by the direction of the logical page (as specified in the page format), not the **LAYOUT** direction. **NEXT** is, therefore, mainly useful in **ACROSS LAYOUT**s.

SAME

Specifies this **LAYOUT** starts at the same vertical position as the previous **LAYOUT**.

=

Alternate for SAME.

DIRECTION Subcommand

DIRECTION {**ACROSS** | **DOWN** | **BACK** | **UP**}

Specifies the print direction of the line relative to the upper-left corner as you view the logical page. Not all printers can print in all print directions. For more information about your printer, refer to your printer documentation.

If **DIRECTION** is not specified, the direction specified in the **PAGEFORMAT** command is used. Observe that this direction is additive to the direction specified in the **PAGEFORMAT** command. See [PAGEFORMAT Command](#), p. 399.

ACROSS

The layout direction is rotated 0 degrees relative to the direction specified in the **PAGEFORMAT** (the layouts are oriented in the same direction as the page).

DOWN

The layout direction is rotated 90 degrees relative to the direction specified in the **PAGEFORMAT**.

BACK

The layout direction is rotated 180 degrees relative to the direction specified in the **PAGEFORMAT**.

UP

The layout direction is rotated 270 degrees relative to the direction specified in the **PAGEFORMAT**.

ENDSPACE Subcommand

ENDSPACE *n* [**IN** | **MM** | **CM** | **POINTS** | **PELS**]

If the remaining body space is less than the value specified, **ENDSPACE** causes a logical page eject to be executed. This can be used, for example, on a **GRPHEADER** layout to ensure that a group header does not print at the end of a page without the first data record of the group.

ENDSPACE does not include the space within the bottom margin (specified on the **PAGEDEF** or **PAGEFORMAT** command). This indicator is ignored on a **PAGEHEADER** or **PAGETRILER** layout.

COLOR Subcommand

Specifies an **OCA** or defined color for the text of this field. This subcommand is recognized only by printers that support multiple-color printing. Refer to your printer publication for information about the colors that can be printed.

COLOR *colorname*

colorname

Values for *colorname* can be a defined color (see [DEFINE COLOR Command](#), p. 279), or an **OCA** *colorname*. Values for **OCA** *colornames* are:

NONE

DEFAULT

BLACK
BLUE
BROWN
GREEN
RED
PINK (or **MAGENTA**)
TURQ (or **CYAN**)
YELLOW
DARKBLUE (or **DBLUE**)
ORANGE
PURPLE
MUSTARD
GRAY
DARKGREEN (or **DGREEN**)
DARKTURQ (**DTURQ**, or **DCYAN**, or **DARKCYAN**)

The color choices depend on the printer.

If you do not enter one of these colors, the default color for that printer is used. **NONE** is the color of the medium, **DEFAULT** is the printer default color.

Note

In some printer manuals, the color turquoise (**TURQ**) is called "cyan", and the color pink (**PINK**) is called "magenta".

PPFA supports the following synonyms:

- **CYAN** for **TURQ**
- **DARKCYAN** for **DARKTURQ**
- **DBLUE** for **DARKBLUE**
- **DCYAN** for **DARKTURQ**
- **DGREEN** for **DARKGREEN**
- **DTURQ** for **DARKTURQ**
- **MAGENTA** for **PINK**

Note

Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **LAYOUT** command. The output is device dependent and may not be what you expect.

Color Model Subcommands

```
[RGB rvalue gvalue bvalue] |
HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
CMYK cvalue mvalue yvalue kvalue |
CIELAB lvalue [(-)] c1value [(-)] c2value
```

These subcommands specify the color of print for this field supported in MO:DCA for the Red/Green/Blue color model (**RGB**), the highlight color space, the Cyan/Magenta/Yellow/Black color model (**CMYK**), and the **CIELAB** color model.

RGB *rvalue gvalue bvalue*

Three **RGB** integer values are used. The first (*rvalue*) represents a value for red, the second (*gvalue*) represents a value for green, and the third (*bvalue*) represents a value for blue. Each of the three integer values may be specified as a percentage from 0 to 100.

↓ **Note**

An **RGB** specification of 0/0/0 is black. An **RGB** specification of 100/100/100 is white. Any other value is a color somewhere between black and white, depending on the output device.

HIGHLIGHT *hvalue* **COVERAGE** *cvalue* **BLACK** *bvalue*

Indicates the highlight color model. Highlight colors are device dependent.

You can use an integer within the range of 0 to 65535 for the *hvalue*.

↓ **Note**

An *hvalue* of 0 indicates that there is no default value defined; therefore, the default color of the presentation device is used.

COVERAGE indicates the amount of coverage of the highlight color to be used. You can use an integer within the range of 0 to 100 for the *cvalue*. If less than 100 percent is specified, the remaining coverage is achieved with the color of the medium.

↓ **Note**

Fractional values are ignored. If **COVERAGE** is not specified, a value of 100 is used as a default.

BLACK indicates the percentage of black to be added to the highlight color. You can use an integer within the range of 0 to 100 for the *bvalue*. The amount of black shading applied depends on the **COVERAGE** percentage, which is applied first. If less than 100 percent is specified, the remaining coverage is achieved with black.

↓ **Note**

If **BLACK** is not specified, a value of 0 is used as a default.

CMYK *cvalue* *mvalue* *yvalue* *kvalue*

Defines the cyan/magenta/yellow/black color model. *cvalue* specifies the cyan value. *mvalue* specifies the magenta value. *yvalue* specifies the yellow value. *kvalue* specifies the black value. You can use an integer percentage within the range of 0 to 100 for any of the **CMYK** values.

CIELAB *Lvalue* (-)*c1value* (-)*c2value*

Defines the **CIELAB** model. Use a range of 0.00 to 100.00 with *Lvalue* to specify the luminance value. Use signed integers from -127 to 127 with *c1value* and *c2value* to specify the chrominance differences.

Lvalue, *c1value*, *c2value* must be specified in this order. There are no defaults for the subvalues.

↓ **Note**

1. Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **LAYOUT** command. The output is device-dependent and may not be what you expect.
2. Do not specify two extended color model subcommands on the same **LAYOUT** command.

FONT Subcommand

```
FONT name1 [, name2]
```

Defines the font to be used for the layout.

name1

Specifies the name of a font used to print the data. This font must have been defined in a previous **FONT**, p. 347 command in this page definition.

If Shift-Out, Shift-In (SOSI) processing is used, *name1* must be the single-byte font.

name2

Specify only when using Shift-Out, Shift-In (SOSI) processing to dynamically switch between a single-byte font and a double-byte font within the layout. *name2* must be the double-byte font.

↓ **Note**

1. If this subcommand is not specified in the print data, the print server uses the font indicated. Otherwise, the print server selects a default font.
2. *name2* is only valid with EBCDIC data.

OBJECT Subcommand

```
OBJECT {lname [0 0 | relX relY] |
        VARIABLE VARIABLE Parameters [0 0 | relX relY]
        OBTYP {PSEG | IOCA | BCOCA | GOCA | PTOCA |
              OTHER OBID {comp-id | typename}}}
```

Other OBJECT Parameters

Specifies the name of an object that is to be positioned and oriented relative to the location specified in the **LAYOUT** command in which the **OBJECT** subcommand was named. The **OBJECT**, as identified by the *lname* parameter, must have been defined by an **OBJECT** command.

↓ **Note**

Multiple page/image objects used without specifying a page using **OBPAGE** will default to using the first page in the object.

You may place multiple objects on the same **LAYOUT** command and you may place the same object multiple times. Each placement must have its own set of placement parameters, as follows:

lname

Specifies the local name of an object that is up to 16 alphanumeric characters in length. The *lname* is used to match the **LAYOUT OBJECT** subcommand to its definition from the **OBJECT** command. An object must be defined with this local name by the **OBJECT** command.

relative-xpos relative-ypos

Specifies the number of units (inches, mm, and so on) that are added to the position of the current **LAYOUT** to position the top-left corner of the object. The values for the horizontal and vertical positioning are limited by the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

Each position specification can be a positive or negative number with up to three decimal places. The units specified can be one of the following: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

VARIABLE

Indicates that the actual name of the object is read from the data record. The **Variable-Name-Locator** field specifies where in the data to get the name.

↓ Note

1. Any object that is to be included in this manner should be defined in the **PAGEDEF** using the **OBJECT** command. Defining objects will enhance performance.
2. If you specify **VARIABLE** for the **OBJECT** name and don't want to print the name, then you must have at least one field command, or code **PRINTDATA NO** on the **LAYOUT** command.

For **VARIABLE** parameters, see "VARIABLE parameters".

OBTYPE

Used to specify the type of the object. Observe that each of the object types restricts the type of mapping option allowed in the placement of the object (**OBMAP** on the **OBJECT** subcommand on the **PRINTLINE** command.)

PSEG

Specifies a page segment object, as described in the *Mixed Object Document Content Architecture (MODCA) Reference Manual*. All mapping types (**OBMAP**) are allowed by PPFA, however, the print server issues an error if any of the objects contained in the page segment are not compatible with the coded **OBMAP** parameter.

GOCA

Specifies a graphic object, as described in the *Graphics Object Content Architecture (GOCA) Reference Manual*. **GOCA** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBMAP** subcommand.

BCOCA

Specifies a bar code object, as described in the *Bar Code Object Content Architecture (BCOCA) Reference Manual*. **BCOCA** allows you to specify only the **LEFT** parameter on the **OBMAP** subcommand.

IOCA

Specifies an image object, as described in the *Image Object Content Architecture (IOCA) Reference Manual*. **IOCA** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBMAP** subcommand.

PTOCA

Specifies a presentation text object with Object Environment Group (OEG) as described in the *Presentation Text Object Content Architecture (PTOCA) Reference Manual* and the *Mixed Object Document Content Architecture (MODCA) Reference Manual*. The

PTOCA object type allows you to specify the **LEFT** parameter in the **OBMAP** subcommand.

OTHER

Specifies other object data. The object data to be included is a paginated presentation object with a format that might or might not be defined by an AFP architecture. When you specify **OTHER**, you must also specify the **OBID** parameter. **OTHER** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBMAP** subcommand.

OBID

Specifies either a component identifier or a type name from Table “NON-OCA Objects Supported by IOB”. The **OBID** is translated into an Encoded OID and matched to the OID inside the object; they must match.

component-id

Specifies the component identifier.

type-name

The name chosen by PPFA as an alternative to coding a component identifier.

Non-OCA Objects Supported by IOB

Type Name	Component ID	Description of OBID Object Type
EPS	13	Encapsulated PostScript
TIFF or TIF	14	Tag Image File Format
WINDIB	17	Device Dependent Bit Map [DIB], Windows Version
OS2DIB	18	Device Dependent Bit Map [DIB], PM Version
PCX	19	Paint Brush Picture File Format
GIF	22	Graphics Interchange Format
JFIF, JPEG, or JPG	23	AFPC (AFP Consortium) JPEG Subset
PDFSPO	25	PDF Single Page Object
PCLPO	34	PCL Page Object
EPSTR	48	EPS with Transparency
PDFSPOTR	49	PDF Single Page Object with Transparency
MTIFF	61	TIFF Multiple Image File
MTIFFNT	62	TIFF Multiple Image without Transparency File

Type Name	Component ID	Description of OBID Object Type
MPDF	63	PDF Multiple Page File
MPDFT	64	PDF Multiple Page with Transparency File
PNG	65	PNG File Format
AFPCTIFF	66	AFPC TIFF subset

Object Types that Can be Referenced as Secondary Resources

Type Name	Component ID	Description of OID Type-Name
PDFRO	26	PDF Resource Object (new)
RESCLRPRO	46	Resident Color Profile Resource Object
IOCAFS45RO	47	IOCA FS45 Resource Object Tile (new)

Other OBJECT Parameters

```
[OBSIZE [USEOBJ | wd [unit] | hg [unit]]]
[OBMAP {LEFT | TRIM | FIT | CENTER | REPEAT | FILL}]
[OBCHPOS [USEOBJ | x-pos]]
[OBCVPOS [USEOBJ | y-pos]]
[OBROTATE [0 | 90 | 180 | 270]]
[OBCOLOR colorname]
[OBPAGE n]
[OBRESOLUTION x y {IN | CM}]
[OBCPSS PSS]
```

OBSIZE

Specifies the size of the object placement area. When no **OBSIZE** is specified, the default is the size specified in the object. If no size is specified in the object, the size of the page is used. The page width is as specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

wd

Specifies the width of an object placement area as a number with up to three decimal places. The allowable width may vary with the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the width parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

↓ Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

hg

Specifies the height of the object placement area as a number with up to three decimal places. The allowable height may vary with the type of printer used and the

L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the height parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

USEOBJ

Specifies that the size measurements specified in the object are to be used. If no size is specified in the object, the size of the page is used, which is the length and width as specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

OBJMAP

Specifies mapping options. The **OBJMAP** parameter defines the mapping of the object to the object placement area. If **OBJMAP** is not coded, the mapping option within the object is used. If the object does not contain a mapping option, then the print server sets it to the created default for the container type.

Each object type (**OBJTYPE** on the **OBJECT** command) dictates the allowable mapping options for that type. When it can, PPFA issues a message when these rules are violated. However, in the case of an object type of page segment (**OBJTYPE=PSEG**), PPFA does not know what types of objects are contained in it; therefore, PPFA cannot enforce the restrictions. See [OBJECT Command, p. 371](#) for a description of the restrictions.

LEFT

Specifies that the object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relative-xpos*, *relative-ypos*, **OBCHPOS**, and **OBCVPOS** parameters. Any portion of the object that falls outside the object placement area as defined by the **OBSIZE** parameter is not trimmed and could cause an exception condition by the presentation system.

TRIM

Specifies position and trim. The object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relative-xpos*, *relative-ypos*, **OBCHPOS**, and **OBCVPOS** parameters. Any portion of the object that falls outside the object placement area as defined by the **OBSIZE** parameter is trimmed.

FIT

Specifies scale to fit; this is the default value if the **OBJMAP** parameter is not coded. The object is to be scaled to fit within the object placement area, as defined by the **OBSIZE** parameter. The center of the object is placed in the center of the object placement area and the object is scaled up or down to fit the block. Scaling in the horizontal and vertical directions is symmetrical. The **FIT** parameter ensures that all of the data in the object is presented in the object placement area at the largest possible size. The object is not trimmed.

CENTER

Specifies that the center of the object be positioned at the center of the object placement area. Any portion of the object that falls outside the object placement area is trimmed.

REPEAT

Specifies that the origin of the data object be positioned with the origin of the object placement area. The object is then replicated in the X and Y directions. If the last replicated data does not fit in the object area, it is trimmed to fit.

FILL

Specifies that the center of the data object be positioned coincident with the center of the object placement area. The data object is then scaled, so that it totally fills the object placement area in both the X and Y directions. This may require that the object be asymmetrically scaled by different scale factors in the X and Y directions.

OBCHPOS

Specifies the horizontal offset of the object contents within the object placement area as a number.

x-pos

Specifies a positive or negative number. The valid options for *x-pos* are described in the **SETUNITS** command for the horizontal value.

USEOBJ

Specifies that the offset value from the object is to be used. If no value is set in the object, the value defaults to 0.

OBCVPOS

Specifies the vertical offset of the object contents within the object placement area, as defined by the **OBSIZE** parameter. If **OBCVPOS** is not specified, it defaults to **USEOBJ** and uses the value set in the object. If no value is set in the object, the value defaults to 0. The **OBCHPOS** parameter is used only in **LEFT** and **TRIM** mapping of the object into the object placement area.

y-pos

Specifies a positive or negative number. The valid options for *y-pos* are described in the **SETUNITS** command for the vertical value.

USEOBJ

Specifies that the offset value from the object is to be used. If no value is set in the object, the value defaults to 0.

OBROTATE { 0 | 90 | 180 | 270 }

Specifies the object rotation with respect to the current LND's coordinate system.

OBCOLOR *colorname*

Specifies the color to be used as the default color or initial color for the object placement area. The **OBCOLOR** parameter is used only for objects of the **PSEG**, **GOCA**, **BCOCA**, **IOCA**, **PTOCA** and **OTHER** type.

colorname

Values for *colorname* can be a defined color (see [DEFINE COLOR Command](#), p. 279) or one of the **OCA** color spaces listed below.

NONE
DEFAULT
BLACK
BLUE
BROWN
GREEN
RED
PINK (or **MAGENTA**)
TURQ (or **CYAN**)
YELLOW
DARKBLUE (or **DBLUE**)
ORANGE
PURPLE
MUSTARD
GRAY
DARKGREEN (or **DGREEN**)
DARKTURQ (**DTURQ**, or **DCYAN**, or **DARKCYAN**)

In Figure “Example of PPFA Support for IOB in a PAGEDEF”, the page definition pd1 has defined an object with an external name of PSEGxyz, of object type PSEG. The object has an internal name of xyzintname. The internal name identifies the object for the **LAYOUT OBJECT** subcommand when the object is placed. Observe that case is not significant on either the internal nor the external names.

Example of PPFA Support for IOB in a PAGEDEF

```
PAGEDEF pd1 Replace Yes
COMMENT 'this is my program';
FONT XF1 ;

OBJECT xyzIntName
  OBXNAME PSEGxyz
  OBTYP E PSEG ;

PAGEFORMAT pf1;
LAYOUT 'abc' POSITION 2 in 1 in;
OBJECT xyzintname 1.1 in 2.1 in
OBSIZE 3 in 5 in
OBMAP FILL
OBCOLOR BLUE ;
```

The **LAYOUT** in **PAGEFORMAT** pf1 places the object on the page 1.1 inches to the left and 2.1 inches below the current **LAYOUT** position. It also maps the object into the object area with the **FILL** parameter, which centers the object in the object area and totally fills the area, possibly with different scaling factors in the X and Y directions. It has an area size of 3 by 5 inches, and overrides the default presentation space color to **BLUE**.

OBPAGE

Specifies the page number of a multipage object or file to be presented. *n* is the page number. A number from 1 to 999999999 (9 digits) is valid.

OBRESOLUTION

Specifies the resolution and unit of measurement of an image. If the resolution is already specified inside the image, this information is ignored by the printer. Use this subcommand for images that do not or may not contain their resolution. Specify resolution of an image so that the printer can print the image correctly.

To specify object resolution, you must have a printer and a print server (PSF or IPM) that support this capability.

If not specified, the default is to assume that the image resolution is the same as the printer. If the image does not print at the size you expect, use `OBRESOLUTION` to identify the image's resolution. With the resolution information, the printer will then be able to print the image at the expected size.

x-res

Specifies the number to be used for the horizontal resolution of an image. Specify an integer value in the range of 1–3276.

y-res

Specifies the number to be used for the vertical resolution of an image. Specify an integer value in the range of 1–3276.

unit

Specifies a unit of measurement. The choices are:

IN

Inch

CM

Centimeter

Code Example:

In the following example, the **OBJECT** subcommand is used to define a JFIF object (which may be specified as JPG). This object has a resolution of 300 pels per inch in both the *x* and *y* directions.

```
Pagedef  obres2  replace  yes;
PRINTLINE  OBJECT  VAR  .4  .5  start  2  length  6
           OBTYP  OTHER  OBID  JPG
           OBRESOL  300  300  IN;
```

OBCPSS

Specifies the presentation space size to be used for the object. **OBCPSS** may be specified once. If **OBCPSS** is specified but no *PSS* value is entered, an error message will be issued.

PSS

Specifies the presentation space size. Values for *PSS* can be:

mediabox — Specifies MediaBox

- cropbox** — Specifies CropBox
- bleedbox** — Specifies BleedBox
- trimbox** — Specifies TrimBox
- artbox** — Specifies ArtBox

OVERLAY Subcommand

```
OVERLAY {name | VARIABLE VARIABLE Parameters}
      [0_0 | rel. x-pos rel. y-pos]
```

Specifies the name of an overlay that is to be positioned relative to the location specified in the **LAYOUT** command in which the **OVERLAY** subcommand was named. The **PAGEFORMAT OVERLAY** command may contain the named overlays. The maximum number of overlays specified for a **PAGEFORMAT** including the **LAYOUT OVERLAY** subcommand is 254.

name

Specifies the user-access name as defined in the **OVERLAY** command.

↓ Note

1. PPFA checks for duplication of local names. If there is a duplication, the page definition is generated, but a warning message is issued.
2. PPFA does not check for duplicate user-access names.

relative-xpos relative-ypos

Specifies the number of units (inches, mm, and so on) that are added to the position of the layout to position the top-left corner of the overlay. The values for horizontal and vertical may be (+) or (-). The maximum value is + or - 32760 L-units. For example:

```
OVERLAY NAME1 2 in 1 in
OVERLAY NAME1 2 in 1 in
```

↓ Note

Any offset coded in the overlay itself is added to this offset.

VARIABLE

Indicates that the actual name of the overlay, including the O1 prefix, is read from the data record. The **Variable-Name-Locator** field specifies where in the data to get the name.

↓ Note

1. Any overlay that is to be included in this manner must be defined in the **PAGEFORMAT** using the **OVERLAY** command. Any overlay included but not defined will cause a run time print error for a missing MPO structured field, for example APS2631.
2. If you specify **VARIABLE** for the **OVERLAY** name and don't want to print the name, then you must have at least one field command, or code **PRINTDATA NO** on the **LAYOUT** command.

Variable Parameters

```
{[START n] LENGTH n |
  FLDNUM n [START n] [LENGTH n] |
  RECID [START n] [LENGTH n]}
```

START *n*

The starting position in the data record to get the overlay name. The first data byte position of the input record is 1. If **START** is not coded, 1 is assumed.

LENGTH *n*

Length of field. Specifies the number (*n*) of bytes to process from the data record, beginning with the position specified in **START**. The maximum length is 8.

FLDNUM *n* [**START** *n*] [**LENGTH** *n*]

The field number. This is the same as in the **FIELD** command. The overlay name is taken from the *n* field of the input data record. **START** *n* and **LENGTH** *n* describe which portion of the *n* field is used. If omitted, the entire field is used to form the overlay name.

RECID *n* [**START** *n*] [**LENGTH** *n*]

Gets the name from the record ID. This is the same as in the **FIELD** command. Use **START** *n* and **LENGTH** *n* to use only a portion of the record ID, or leave them out to use the entire record field.

OVROTATE {0 | 90 | 180 | 270}

Specifies the rotation of the placed overlay with respect to the x-axis of the page.

See [FORMDEF Command, p. 235](#) for an **OVROTATE** example, which is presented in the **FORMDEF** description.

SEGMENT Subcommand

```
SEGMENT {name | VARIABLE VARIABLE Parameters}
        [0 0 | rel. x-pos rel. y-pos]
```

Specifies the name of a segment that is to be positioned relative to the location specified in the **LAYOUT** command in which the **SEGMENT** subcommand was named. The **PAGEFORMAT SEGMENT** command may contain the named segments. The maximum number of segments specified for a **PAGEFORMAT**, including the **LAYOUT SEGMENT** subcommand, is 127.

name

Specifies the user-access name as defined in the **SEGMENT** command.

 **Note**

1. PPFA checks for duplication of local names. If there is a duplication, the page definition is generated, but a warning message is issued.
2. PPFA does not check for duplicate user-access names.

relative-xpos relative-ypos

Specifies the number of units (inches, mm, and so on) that are added to the position of the layout to position the top-left corner of the page segment. The values for horizontal and vertical may be (+) or (-). The maximum value is + or - 32760 L-units. For example:

```
SEGMENT MYSEG1 2 in 1 in
SEGMENT MYSEG1 2 in 1 in
```

VARIABLE

Indicates that the actual name of the segment, including the S1 prefix, is read from the data record. The **Variable-Name-Locator** field specifies where in the data to get the name.

Note

If you specify **VARIABLE** for the **SEGMENT** name and don't want to print the name, then you must have at least one field command, or code **PRINTDATA NO** on the **LAYOUT** command.

For **VARIABLE** parameters, see "VARIABLE parameters".

OBJECT Command

OBJECT Command

```
OBJECT lname
OBXNAME {x-name | 'x-name' | C'x-name' |
          E'x-name' | A'x-name' | X'hhhh' | U8'xname' |

[RIPPAGE {n | ALL}]
[RIPCOLOR {color-name}]
[RIPPSS {PSS}]
```

The **OBJECT** command allows you to define an external object to PFFA. Then you can use the **PRINTLINE** command (Traditional) or the **LAYOUT** command (Record Format and XML) with the **OBJECT** subcommand to place the defined object on a page.

You can use one **PRINTLINE** command (Traditional), **LAYOUT** command (Record Format), or **XLAYOUT** command (XML) to place one or many defined objects multiple times with different placement parameters on each placement. On the **PRINTLINE OBJECT** subcommand, enter information about the positioning, rotation, color, object size, page number, and mapping instructions. All positioning is relative to the print line coordinate system. The *lname* appears both on the **OBJECT** command and on the **PRINTLINE OBJECT** subcommand (Traditional), the **LAYOUT OBJECT** command (Record Format), or the **XLAYOUT OBJECT** command (XML).

↓ Note

1. The *Iname* is case insensitive but, other than that, the *Iname* of the **OBJECT** command and of the **PRINTLINE OBJECT** subcommand (Traditional), the **LAYOUT OBJECT** command (Record Format), and the **XLAYOUT OBJECT** command (XML) must match exactly.
2. This function requires both the print server and printer support. Check your print server and printer documentation.
3. Fonts used by the **OBJECT** must be mapped. You can use the **EXTREF** command to map a font.
4. CMRs used by the **OBJECT** must be mapped. You can use the **EXTREF OB2CMR** command to map a CMR.

3

OBJECT *Iname*

Identifies the object and also is used to match a **PRINTLINE OBJECT** subcommand (Traditional), the **LAYOUT OBJECT** command (Record Format), and the **XLAYOUT OBJECT** command (XML). The *Iname* can be no more than 16 alphanumeric characters.

Subcommands

OBXNAME Subcommand

```
OBXNAME {x-name | 'x-name' | C'x-name' |
         E'x-name' | A'x-name' | X'hhhh' | U8'xname' |
         X8'hhhh' | U16'x-name' | X16'hhhh' }
```

Specifies the external name of the resource object, which indicates where the object is located. This is the user access name which indicates where the object is located on the file system.

↓ Note

1. Since this is a file system name, it must adhere to the rules of the platform where the object is located which could further restrict the sizes below, for example:
 - On z/OS, the *x-name* is the member name of the object in the object library and must be 8 characters or less and in uppercase EBCDIC code page 500.
2. All translations described below assume code page International #5 (code page 500) for EBCDIC and LATIN1 ISO/ANSI 8-bit (code page 819) for ASCII.

x-name

An unquoted name up to 250 characters long will be folded to upper case and translated into EBCDIC if necessary.

'*x-name*'

A quoted name up to 250 characters long will be accepted as-is with no case folding or translation.

C'*x-name*'

A quoted name with a "C" for Character will be treated the same as a quoted name up to 250 characters. No folding or translation is done.

A'*x-name*'

A quoted name with an "A" for ASCII entered with up to 250 single-byte characters will be accepted as-is if on an ASCII platform or converted to ASCII if on an EBCDIC platform. The conversion will be made with no case folding.

E'*x-name'*

A quoted name with an "E" for EBCDIC entered with up to 250 single-byte characters will be accepted as-is if on an EBCDIC platform or converted to EBCDIC if on an ASCII platform. The conversion will be made with no case folding.

X'*hhhh'*

A quoted name with an "X" for Hexadecimal entered with up to 500 hexadecimal characters. The characters will be converted to hexadecimal, but no assumption of data type will be made.

U8'*x-name'*

A quoted name with an "U8" for UTF-8 entered with up to 250 single-byte characters will be translated to UTF-8.

X8'*hhhh'*

A quoted name with an "X8" for UTF-8 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-8. There must be a multiple of 2 hexadecimal characters entered.

U16'*x-name'*

A quoted name with a "U16" for UTF-16 entered with up to 125 single-byte characters will be translated to UTF-16.

X16'*hhhh'*

A quoted name with an "X16" for UTF-16 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-16. There must be a multiple of 4 hexadecimal characters entered.

To have portability across older versions of print servers in multiple system environment platforms, it is recommended that resource object names use EBCDIC encoding with code page 500.

OBTYPE Subcommand

```
OBTYPE {PSEG | IOCA | BCOCA | GOCA |
        PTOCA | OTHER OBID {component-id | type-name}}
```

Used to specify the type of the object. Observe that each of the object types restricts the type of mapping option allowed in the placement of the object (**OBMAP** on the **OBJECT** subcommand on the **PRINTLINE** command (Traditional) or the **LAYOUT** command (Record Format and XML)).

PSEG

Specifies a page segment object, as described in the *Mixed Object Document Content Architecture (MODCA) Reference Manual*. All mapping types (**OBMAP**) are allowed by PPGA; however, the print server issues an error if any of the objects contained in the page segment is not compatible with the coded **OBMAP** parameter.

GOCA

Specifies a graphics object, as described in the *Graphics Object Content Architecture (GOCA) Reference Manual*. **GOCA** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBTMAP** subcommand.

BCOCA

Specifies a bar code object, as described in the *Bar Code Object Content Architecture (BCOCA) Reference Manual*. **BCOCA** allows you to specify only the **LEFT** parameter on the **OBTMAP** subcommand.

IOCA

Specifies a image object, as described in the *Image Object Content Architecture (IOCA) Reference Manual*. The **IOCA** object type allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBTMAP** subcommand.

PTOCA

Specifies a presentation text object with Object Environment Group (OEG) as described in the *Presentation Text Object Content Architecture (PTOCA) Reference Manual* and the *Mixed Object Document Content Architecture (MODCA) Reference Manual*. The **PTOCA** object type allows you to specify the **LEFT** parameter in the **OBTMAP** subcommand.

OTHER

Specifies other object data. The object data to be included is a paginated presentation object with a format that may or may not be defined by an AFP presentation architecture. When you specify **OTHER**, you must also specify the **OBID** parameter. The **OTHER** object type allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBTMAP** subcommand.

OBID

Specifies either a component identifier or a type name from Table "Non-OCA Objects Supported by IOB". The **OBID** is translated into an Encoded OID and matched to the OID inside the object; they must match.

component-id

Specifies the component identifier.

type-name

Type-name is a name chosen by PPFA as an alternative to coding a component identifier.

Non-OCA Objects Supported by IOB

Type Name	Component ID	Description of OBID Object Type
EPS	13	Encapsulated PostScript
TIFF or TIF	14	Tag Image File Format
WINDIB	17	Device Dependent Bit Map [DIB], Windows Version
OS2DIB	18	Device Dependent Bit Map [DIB], PM Version
PCX	19	Paintbrush Picture File Format

Type Name	Component ID	Description of OBID Object Type
GIF	22	Graphics Interchange Format
JFIF, JPEG, or JPG	23	AFPC (AFP Consortium) JPEG Subset

Object Types that can be referenced as Secondary Resources

Type Name	Component ID	Description of OID Type-Name
PDFRO	26	PDF Resource Object (new)
RESCLRPRO	46	Resident Color Profile Resource Object
IOCAFS45RO	47	IOCA FS45 Resource Object Tile (new)

RENDER Subcommand

```
RENDER { PERCEPTUAL | SATURATION | RELCM | ABSCM }
```

The **RENDER** subcommand on the **OBJECT** command specifies the rendering intent (RI) for an object within a page definition.

RI is used to modify the final appearance of color data and is defined by the International Color Consortium (ICC). For more information on RI see the current level of the ICC Specification.

Not all object types have rendering intent. Rendering intent will be ignored for those object types. The following is a list of object types that can be specified as parameters on the **OBTYPE** subcommand and the resulting rendering intent object type:

- PSEG: The rendering intent specified on a PSEG is used for all object types.
- IOCA: Supported.
- BCOCA: Not supported. The rendering intent for BCOCA objects is fixed as media-relative colorimetric (RELCM).
- GOCA: Supported.

- PTOCA: Supported.
- OTHER: Supported.

PERCEPTUAL

Perceptual rendering intent. It can be abbreviated as **PERCP**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to give a pleasing appearance. This intent is typically used to render continuous-tone images.

SATURATION

Saturation rendering intent. It can be abbreviated as **SATUR**. With this rendering intent, gamut mapping is vendor-specific, and colors are adjusted to emphasize saturation. This intent results in vivid colors and is typically used for business graphics.

RELCM

Media-relative colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered with respect to the source white point and are adjusted for the media white point. Therefore colors printed on two different media with different white points won't match colorimetrically, but may match visually. This intent is typically used for vector graphics.

ABSCM

ICC-absolute colorimetric rendering intent. In-gamut colors are rendered accurately, and out-of-gamut colors are mapped to the nearest value within the gamut. Colors are rendered only with respect to the source white point and are not adjusted for the media white point. Therefore colors printed on two different media with different white points should match colorimetrically, but may not match visually. This intent is typically used for logos.

CMYKSWOP or CMYKEURO Subcommand

```
[CMYKSWOP | CMYKEURO]
```

Indicates the color profile if it is required by the object.

OBKEEP or OBNOKEEP Subcommand

```
OBNOKEEP | OBKEEP {NOPRELOAD |  
PRELOAD {NOPRERIP | PRERIP PRERIP Parameters}}
```

OBNOKEEP

This object name is not included in a Map Data Resource structured field. The object must be loaded each time the object is placed on the page. This is the default value.

OBKEEP

This object is included in a Map Data Resource at the beginning of the **PAGEDEF**, making a hard object at the beginning of the page. The object is then available throughout without reloading. Note that only objects with **OBTYPE IOCA** and **OTHER** can be kept. If **OBKEEP** is coded with other types than those it is ignored.

NOPRELOAD

Do not preload this object. This is the default value.

PRELOAD

Preload this object prior to processing the print job.

NOPRERIP

Do not prerip this object. This is the default value.

PRERIP

Prepare the object for printing by rasterizing it with its presentation parameters: object area size, object mapping option, object content offset, object color and object rotation with respect to the media leading edge.

For **PRERIP** parameters, see "PreRip Parameters".

OB2RESOURCE Subcommand

```
OB2RESOURCE {i2name | 'i2name' | C'i2name' | E'i2name' |
              A'i2name' | X'hhhh'}
OB2XNAME {x2name | 'x2name' | C'x2name' | E'x2name' |
           A'x2name' | X'hhhh' | U8'x2name' | U16'x2name' |
           X8'hhhh' | X16'hhhh'}
OB2ID {n | type-name} [NOPRELOAD | PRELOAD]
```

If the primary object contains a reference to one or more secondary objects, you must identify them at this point. The **OB2RESOURCE** subcommand identifies a secondary object other than a CMR.

Specify the internal name for the secondary resource as specified in the primary resource. If the internal name contains special characters such as periods or blanks, then quotes must surround the name.

i2name

An unquoted name up to 250 characters long will be folded to upper case and translated into EBCDIC if necessary.

'*i2name*'

A quoted name up to 250 characters long will be accepted as-is with no case folding or translation.

C'*i2name*

A quoted name with a "C" for Character will be treated the same as a quoted name of up to 250 characters. No folding or translation will be done.

A'*i2name*

A quoted name with an "A" for ASCII entered with up to 250 single-byte characters will be accepted as-is if on an ASCII platform or translated to ASCII if on an EBCDIC platform. The translation will be made with not case folding.

E'*i2name*

A quoted name with an "E" for EBCDIC entered with up to 250 single-byte characters will be accepted as-is if on an EBCDIC platform or translated to EBCDIC if on an ASCII platform. The translation will be made with not case folding.

X'*hhhh*

A quoted name with an "X" for Hexadecimal entered with up to 500 hexadecimal characters. The characters will be translated to hexadecimal, but no assumption of data type will be made.

OB2XNAME

Specifies the external name for a secondary resource object. The name can be up to 250 characters. If the name contains special characters or blanks, it must be enclosed in blanks.

Note

Since this is a file system name, it must adhere to the rules of the platform where the object is located. This could further restrict the sizes as listed below.

x2name

An unquoted name up to 250 characters long will be folded to upper case and translated into EBCDIC if necessary.

'*x2name*'

A quoted name up to 250 characters long will be accepted as-is with no case folding or translation.

C'*x2name*

A quoted name with a "C" for Character will be treated the same as a quoted name up to 250 characters. No folding or translation is done.

A'*x2name*

A quoted name with an "A" for ASCII entered with up to 250 single-byte characters will be accepted as-is if on an ASCII platform or translated to ASCII if on an EBCDIC platform. The translation will be made with no case folding.

E'*x2name*

A quoted name with an "E" for EBCDIC entered with up to 250 single-byte characters will be accepted as-is if on an EBCDIC platform or translated to EBCDIC if on an ASCII platform. The translation will be made with no case folding.

X'*hhhh*

A quoted name with an "X" for Hexadecimal entered with up to 500 hexadecimal characters will be translated to hexadecimal, but no assumption of data type will be made.

U8'*x2name*

A quoted name with an "U8" for UTF-8 entered with up to 250 single-byte characters will be translated to UTF-8.

X8'*hhhh*

A quoted name with an "X8" for UTF-8 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-8. There must be a multiple of 2 hexadecimal characters entered.

U16'*x2name*

A quoted name with an "U16" for UTF-16 entered with up to 125 single-byte characters will be translated to UTF-16.

X16'*hhhh*

Quoted name with an "X16" for UTF-16 HEX entered with up to 500 single-byte hexadecimal characters will be translated to hexadecimal and assumed to be data type UTF-16. There must be a multiple of 4 hexadecimal characters entered.

All specified secondary resources are kept. See **OBKEEP** for more information.

OB2ID

Component type identifier for secondary resource; use an object type number as specified in Object type list adjustments. Use an object type number from the "Component ID" column or a type name from the "Type Name" column of Table "Object Types that can be referenced as Secondary Resources".

NOPRELOAD | PRELOAD

All specified secondary resources are kept. If you wish the secondary object to be preloaded prior to the running of this job, specify it here.

OB2CMR Subcommand

```
OB2CMR cmr-1name {AUDIT | INSTR | LINK} [NOPRELOAD | PRELOAD]
```

The **OB2CMR** subcommand specifies a color management resource (CMR) and its process mode for a data object within the PAGEDEF. CMRs are secondary objects when used at this level. Multiple **OB2CMR** subcommands are allowed on the **OBJECT** command.

cmr-1name

The CMR local name. This name must have been defined with a **DEFINE CMRNAME** command.

AUDIT | INSTR | LINK

Specify the processing mode for the CMR.

AUDIT

CMRs with the audit processing mode refer to processing that has already been applied to a resource. In most cases, audit CMRs describe input data and are similar to ICC input profiles.

The audit processing mode is used primarily with color conversion CMRs. In audit processing mode, those CMRs indicate which ICC profile must be applied to convert the data into the Profile Connection Space (PCS).

INSTR

CMRs with the instruction processing mode refer to processing that is done to prepare the resource for a specific printer using a certain paper or another device. Generally, instruction CMRs refer to output data and are similar to ICC output profiles.

The instruction processing mode is used with color conversion, tone transfer curve, and halftone CMRs. In instruction processing mode, these CMRs indicate how the system must convert a resource so it prints correctly on the target printer. The manufacturer of your printer should provide ICC profiles or a variety of CMRs that you can use. Those ICC profiles and CMRs might be installed in the printer controller, included with the printer on a DVD, or available for download from the manufacturer's Web site.

LINK

This CMR defines a direct color conversion from an input color space to a device output color space; process the CMR as a link CMR. This processing mode is only

valid for device link (DL) CMRs. The PPFA command RENDER is not used with device link (DL) CMRs as such CMRs specify the intended rendering intent internally. This function requires print server (PSF) and printer support which is in addition to the original CMR support.

NOPRELOAD | PRELOAD

All specified secondary resources are kept. If you wish the CMR object to be preloaded prior to the running of this job, specify it here.

Code Example:

In the following example, an object with CMR is defined. The **LAYOUT** commands below place the object on the page. The CMR name is defined and referenced by the CMR local name. See the **DEFINE CMRNAME** command for examples and instructions on defining CMR names.

```
PAGEDEF cmr89  replace yes;
  FONT  varb  gt10  ;           /*Variable data           */
  SETUNITS  LINESP .25 in ;    /* Line spacing           */

DEFINE srgb CMRNAME
'sRGBicc_CC001.000@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@@'
'@@@@@';

Object oc1  obxname 'Flowers_with_sRGB_profile'
  obtype  other  obid 23  OBKEEP
  ob2cmr  srgb  audit

  PAGEFORMAT  rept1  TOPMARGIN 1 in  BOTMARGIN 2 in;
  LAYOUT 'startpage' BODY  NEWPAGE POSITION 1 in  NEXT
    font  varb
  object oc1 0 in 3 in  obsize 6.5 in 8.5 in;
  LAYOUT 'basicline' BODY  POSITION SAME  NEXT  font  varb;
```

OBRESOLUTION Subcommand

```
OBRESOLUTION x y {IN | CM}
```

Specifies the resolution and unit of measurement of an image. If the resolution is already specified inside the image, this information is ignored by the printer. Use this subcommand for images that do not or may not contain their resolution. Specify resolution of an image so that the printer can print the image correctly.

To specify object resolution, you must have a printer and a print server (PSF or IPM) that support this capability.

If not specified, the default is to assume that the image resolution is the same as the printer. If the image does not print at the size you expect, use **OBRESOLUTION** to identify the image's resolution. With the resolution information, the printer will then be able print the image at the expected size.

x-res

Specifies the number to be used for the horizontal resolution of an image. Specify an integer value in the range of 1–3276.

y-res

Specifies the number to be used for the vertical resolution of an image. Specify an integer value in the range of 1–3276.

unit

Specifies a unit of measurement. The choices are:

IN

Inch

CM

Centimeter

Code Example:

In the following example, the **OBJECT** command is used to define two JFIF objects. One is pre-ripped and the other is not. One has a resolution of 300 pels per inch in both the x and y directions. The other has a resolution of 600 pels per inch in both the x and y directions.

```
SETUNITS 2 in 2 in;
Pagedef obxres

OBJECT obres1 OBXNAME xpseg23 OBTYPE other OBID JFIF
      OBRESOLUTION 300 300 IN;
OBJECT obres2 OBXNAME xpseg24 OBTYPE other OBID JFIF
      OBRESOLUTION 600 600 IN;

PRINTLINE OBJECT obres1
  23 PELS 01 PELS  OMap TRIM  OBSIZE  1.2 in 1.3 in ;
PRINTLINE OBJECT obres2
  34 PELS 01 PELS  OMap TRIM  OBSIZE  1.2 in 1.3 in ;
```

3

PRERIP Parameters

```
[RIPSIZE [USEOBJ | wd [unit]] hg [unit]]]
[RIPMAP {LEFT | TRIM | FIT | CENTER | FILL}]
[RIPOFFSET rel x [unit]] rel y [unit]]]
[RIPROTATE [0 | 90 | 180 | 270]...]
[RIPPAGE {n | ALL}]
[RIPCOLOR {color-name}]
[RIPPSS {PSS}]
```

These parameters are used to specify the exact rasterization of the object, its size, offset, mapping, and rotations.

Note

1. To specify multiple pages, rip sizes, mappings, and offsets for the same object, code multiple object commands.
2. **Mapping:** Mapping an object (also known as KEEPing) enhances throughput by allowing the printer to download an object once and use it on subsequent pages of the same print job or possibly on subsequent print jobs. Secondary objects are always mapped.
3. **Preloading:** Preloading an object consists of loading the object into the printer memory before the print job is started. This enhances throughput because it removes the downloading time from print-time to page build time.
4. **Preripping:** Preripping further enhances throughput because it allows the object and its secondary objects to be rasterized (RIPped) at the proper size and rotation when they are preloaded. When a primary object is preripped, all its secondary objects are also preloaded and preripped.

RIPSIZE

Specifies the size of the object placement area. When no **RIPSIZE** is specified, the default is the size specified in the object. If no size is specified in the object, the size of the page is

used. The page width is specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

USEOBJ

Specifies that the size measurements specified in the object are to be used. If no size is specified in the object, the size of the page is used, which is the length and width as specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

wd

Specifies the width of an object placement area as a number with up to three decimal places. The allowable width may vary with the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the width parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

↓ Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

hg

Specifies the height of an object placement area as a number with up to three decimal places. The allowable height may vary with the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the height parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

↓ Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

RIPMAP

Specifies mapping options. The **RIPMAP** parameter defines the mapping of the object to the object placement area. If **RIPMAP** is not coded, the mapping option within the object is used. If the object does not contain mapping option, then the print server sets it to the created default for container type. Each object type (**OBTYPE** on the **OBJECT** command) specifies the allowable mapping options for that type. See the **OBJECT OBTYPE** parameter for a description of the restrictions.

FIT

Specifies scale to fit. This is the default value of the **RIPMAP** parameter is not coded. The object is to be scaled to fit within the object placement area, as defined by the **RIPSIZE** parameter. The center of the object is placed in the center of the object placement area and the object is scaled up or down to fit the block. Scaling in the horizontal and vertical directions is symmetrical. The **FIT** parameter ensures that all

of the data in the object is presented in the object placement area at the largest possible size. The object is not trimmed.

FILL

Specifies that the center of the data object be positioned coincident with the center of the object placement area. The data object is then scaled, so that it totally fills the object placement area in both the X and Y directions. This may require that the object be asymmetrically scaled by different scale factors in the X and Y directions.

LEFT

Specifies that the object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relative-xpos*, *relative-ypos*, and **RIPOFFSET** parameters. Any portion of the object that falls outside the object placement area as defined by the **RIPSIZE** parameter is not trimmed and could cause an exception condition by the presentation system. This mapping type is invalid with an IOCA object.

TRIM

Specifies position and trim. The object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relative-xpos*, *relative-ypos*, and **RIPOFFSET** parameters. Any portion of the object that falls outside the object placement area as defined by the **RIPSIZE** parameter is trimmed.

CENTER

Specifies that the center of the object positioned at the center of the object placement area. Any portion of the object falls outside the object placement area is trimmed.

RIPOFFSET

Specifies the horizontal and vertical offset of the object contents within the object placement area, as defined by the **RIPSIZE** parameter. If **RIPOFFSET** is not specified, the object is preprocessed and cached at its full size. The content offset specified at Include time is then used to place and possibly trim the object to the object area, with an associated performance penalty.

The **RIPOFFSET** parameter is used only in **LEFT** and **TRIM** mapping of the object into the object placement area.

rel-x

Specifies the offset along the X-axis of the object area coordinates system. This can be a positive or negative number.

unit

Specifies a unit of measurement for the X-axis offset parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

rel-y

Specifies the offset along the Y-axis of the object area coordinates system. This can be a positive or negative number.

unit

Specifies a unit of measurement for the Y-axis offset parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

RIPROTATE

Specifies the object rotation with respect to the leading edge of the media. Up to 4 rotations can be specified.

Note

Many factors, such as media selection, media side, media loading media orientation, page orientation, and object area rotation affect the orientation of an object with respect to the media leading edge. Therefore proper specification of this parameter may require visual inspection of physical output.

RIPPAGE

Specifies the page number of a multipage object or file to be pre-RIPped. *n* is the page number. A number from 1 to 999999999 (9 digits) is valid. **ALL** specifies to pre-RIP all objects in a multipage object.

RIPCOLOR

RIPCOLOR*color-name*

Specifies the color to be used as the default color for the object placement area. This color will be stored with the preRIPped object.

color-name

Specifies the color. Values for *color-name* can be a defined color or an OCA color. *Color-name* may have been previously defined using the **DEFINE COLOR** command.

RIPPSS

RIPPSS*PSS*

Specifies the presentation space size to be used for the object. **RIPPSS** may be specified once. If **RIPPSS** is specified but no *PSS* value is entered, a message will be issued.

PSS

Specifies the presentation space size. Values for *PSS* can be:

- mediabox** — Specifies MediaBox
- cropbox** — Specifies CropBox
- bleedbox** — Specifies BleedBox
- trimbox** — Specifies TrimBox
- artbox** — Specifies ArtBox

Examples: In the page definition below there are several examples of long names. This is for illustration only.

- **OBU8:** The primary object name is specified in "U8" format which means that it is specified as a character string and translated to UTF-8 encoding.
The secondary object defined on object OBU8 is referenced in the primary object with an identifier which is the equivalent of hexadecimal X'ABF8'. The external name for that object is specified in "C" format which means that the name is accepted as it with no translation or folding of case.
- **OBU16:** This object name is specified in "U16" format which means that it is specified as a character string and translated to UTF-16 encoding.
- **OBX16:** This object name is specified in "X16" format which means that it is specified as a Hexadecimal string representing the UTF-16 encoding. It is not translated. The only check that PPFA will make is that its length is a multiple of 4.

OVERLAY Command

```

OVERLAY x-name [NOPRELOAD |
                PRELOAD [NOPRERIP |
                        PRERIP [RIPROTATE [0 | 90 | 180 | 270]...]]] ;

```

The **OVERLAY** command is used to identify an electronic overlay to be included in the print file. This function is similar to the **SEGMENT** command. A separate **OVERLAY** command is required for each overlay, including all overlay names that may be used with the **OVERLAY VARIABLE** keyword on **PRINTLINE**, **LAYOUT** or **XLAYOUT**. A maximum of 254 **OVERLAY** commands can be specified for each page format. Each of the 254 names must be unique

The **OVERLAY** commands are nested within the **PAGEFORMAT** command.

- For Traditional:

```

PAGEFORMAT, p. 399
  [ TRCREF, p. 427 ]
  [ SEGMENT, p. 425 ]
  [ OVERLAY ]
  ⋮
  [ OVERLAY ]

```

- For Record Format and XML:

```

PAGEFORMAT, p. 399
  [ SEGMENT, p. 425 ]
  [ OVERLAY ]
  ⋮
  [ OVERLAY ]

```

An overlay can be requested in the following two ways:

- Place the overlay using the **OVERLAY** subcommand on the **PRINTLINE** command (Traditional), the **LAYOUT** command (Record Format), or the **XLAYOUT** command (XML).
- Enter an Include Page Overlay (IPO) structured field in the line data. The name of the overlay on the IPO structured field must match exactly the overlay identified by this command. The IPO must specify a value of X'FFFFFF' for the X and Y offset parameters if the overlay is to be placed relative to the current line position.

To include page overlays without using the IPO structured field, see the [PRINTLINE Command \(Traditional\)](#), p. 405.

OVERLAY

Identifies the overlay that is positioned on the page.

x-name

The user access name (external name) for the overlay. *x-name* can be unquoted or enclosed in quotes.

unquoted-name

An unquoted overlay name can be up to 6 characters. It is folded to upper case, has a "O1" prefix added to it, and is translated to EBCDIC codepage 500 if necessary.

'*quoted-name*'

A quoted overlay name can be up to 8 characters. No translation or case folding is done.

Subcommands

<pre>[NOPRELOAD PRELOAD [NOPRERIP PRERIP [RIPROTATE {<u>0</u> 90 180 270}...]]]</pre>
--

These subcommands are used to specify whether or not to preload and/or prerip overlays.

Note

1. The printer must support the preloading and pre-ripping functions.
2. **Mapping:** Mapping an overlay enhances throughput by allowing the printer to download an object once and use it on subsequent pages of the same print job or possibly on subsequent print jobs. Overlays are always mapped so it is not necessary for you to request mapping. Mapping an overlay provides sufficient performance for most applications.
3. **Preloading:** Preloading an overlay consists of loading the object into printer memory before the print job is started. This enhances throughput by removing downloading time from real time to the page build time.
4. **Preripping:** Preripping enhances throughput by allowing the resources to be rasterized (RIPped) at the proper size and rotation when they are preloaded.

NOPRELOAD or PRELOAD Subcommand

<pre>NOPRELOAD PRELOAD [NOPRERIP PRERIP [RIPROTATE {<u>0</u> 90 180 270}...]]]</pre>
--

NOPRELOAD

Do not preload the overlay.

PRELOAD

Preload the overlay before processing the print job.

NOPRERIP

Do not prerip the overlay.

PRERIP

Prepare the overlay for printing by rasterizing it with its presentation rotation with respect to the media leading edge.

RIPROTATE { 0 | 90 | 180 | 270 }

Specifies the overlay rotation with respect to the leading edge of the media. Up to 4 rotations can be specified.

Note

1. Many factors, such as media selection, media side media loading, media orientation, page rotation, and overlay area rotation affect the orientation of the overlay with respect to the media leading edge. Therefore, proper specification of this parameter may require visual inspection of physical output.
2. The prefix "O1" is not part of the six-character user-access name. The overlay name can be alphanumeric.

3

Code Example

In the following example, an overlay is defined and placed. The overlay will be preripped in 2 orientations, 180 and 0.

```
PAGEDEF RipXm2 Replace Yes;
PAGEFORMAT pf1;
OVERLAY ripit PRELOAD PRERIP OVBROTATE 180,0 ;

PRINTLINE OVERLAY ripit;
```

PAGEDEF Command

```
PAGEDEF name [COMMENT 'qstring'...]
[WIDTH {8.3 IN | n [unit]}]
[HEIGHT {10.8 IN | n [unit]}]
[LINEONE x-pos y-pos]
[DIRECTION {ACROSS | DOWN | BACK | UP}]
[REPLACE {NO | YES}]
[PELSPERINCH n]
[TOPMARGIN n [IN | MM | CM | POINTS | PELS]]
[BOTMARGIN n [IN | MM | CM | POINTS | PELS]]
[LEFTMARGIN n [IN | MM | CM | POINTS | PELS]]
[RIGHTMARGIN n [IN | MM | CM | POINTS | PELS]]
[SOSIFONTS sbc-font , dbc-font]
[UDType {EBCDIC | ASCII | UTF8 | UTF16}]
[RECIDLEN 10 | n] ;
```

Note

1. The **LINEONE** subcommand is valid only for traditional page definitions.
2. The **TOPMARGIN**, **BOTMARGIN**, **LEFTMARGIN**, and **RIGHTMARGIN** subcommands are valid only for record format and XML page definitions.
3. If **UDType** is not specified:
 - For traditional and record format page definitions, there is no default value. This means that no data type information is added to the page definition.
 - For XML page definitions, the default value depends on the platform: **EBCDIC** for z/OS or **ASCII** for Windows.
4. The **RECIDLLEN** subcommand is valid only for record format page definitions.

A page definition is a resource used to define how data is formatted on a logical page. When generated by PPFA, a page definition is stored as a resource in the page-definition library. This command's subcommands allow you to use the page definition with the Record Format line data.

This command must be specified when you define a page definition. All **PAGEDEF** subcommands are optional; defaults are assumed.

For traditional page definitions only: Values assigned within the subcommands or the default values become the values for any **PAGEFORMAT**, p. 399 subcommand not specified. **REPLACE** is not a **PAGEFORMAT** subcommand, so its default is not carried forward.

PAGEDEF

Identifies the page definition to be used with the print job.

name

Defines an alphanumeric name of 1 to 6 characters for the page definition. When page definitions are generated, PPFA assigns the prefix 'P1' to this name as the external resource name.

Subcommands

COMMENT Subcommand

```
COMMENT 'qstring'...
```

Specifies a user comment. This string comment is placed in the NOP structured field of the page definition.

'qstring'

Specifies a quoted set of strings from 1 to 255 characters in total length.

WIDTH Subcommand

```
WIDTH {8.3 IN | n [unit]}
```

Defines the width of the logical page.

n

A number with up to three decimal places is used. The width may vary according to the type of printer being used. For more information, refer to your printer documentation. The default is **8.3 IN**.

unit

Specifies a unit of measurement for the **WIDTH** subcommand. The choices are **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

HEIGHT Subcommand

```
HEIGHT {10.8 IN | n [unit]}
```

Defines the height of the logical page.

n

A number with up to three decimal places is used. The height may vary according to the type of printer being used. For more information, refer to your printer documentation. The default is **10.8 IN**.

unit

Specifies a unit of measurement for the **HEIGHT** subcommand. The choices are **IN**, **MM**, **CM**, **POINTS**, and **PELS**.

Note

If no unit is specified, the default is the most recent **SETUNITS**, p. 425 command value or **IN** (inch) if a **SETUNITS** command has not been issued.

LINEONE Subcommand (Traditional)

```
LINEONE x-pos y-pos
```

Specifies the values for the **MARGIN** and **TOP** parameters used in the **POSITION** subcommand of the **PRINTLINE**, p. 405 command.

x-pos

Specifies the offset from the left edge of the logical page (margin position). The valid options for *x-pos* are described in the **SETUNITS** command for the horizontal value.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

y-pos

Specifies the vertical offset from the top of the logical page (top line position). The valid options for *y-pos* are described in the **SETUNITS** command for the vertical value.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

DIRECTION Subcommand

DIRECTION {ACROSS | DOWN | BACK | UP}

Specifies the print direction of the logical page. Not all printers can print in all print directions. For more information, refer to your printer documentation.

Note

Some printers have a different media origin and require different direction settings than most page printers. For printing in the landscape page presentation when using wide forms, the **PRESENT** subcommand must be specified on the **FORMDEF** command to produce readable output. Alternatively, if you have existing page definitions, the **UP** direction can be used in the page definition without changes to the form definition to produce the same result.

ACROSS

The page is printed with the characters added *left to right* in each line, and the lines added from the top to the bottom.

DOWN

The page is printed with the characters added to the page from *top to bottom*, and the lines added from the right to the left.

BACK

The page is printed with the characters added to the page from *right to left*, and the lines added from the bottom to the top.

UP

The page is printed with the characters added to the page from *bottom to top*, and the lines added from the left to the right.

For Record Format and XML, **DIRECTION** affects the meaning of the following new margin parameters:

- If the **DIRECTION** is **ACROSS**, then **TOPMARGIN** refers to the margin in the short end of the physical page where the tops of the characters point toward that same short end.
- If the **DIRECTION** is **DOWN**, then **TOPMARGIN** refers to the margin in the long end of the physical page where the tops of the characters point toward that same long end.

REPLACE Subcommand

REPLACE {NO | YES}

Specifies whether this page definition is to replace an existing one with the same resource name in the library.

NO

This page definition does not replace one with the same resource name in the library.

If a page definition with the same resource name does not exist in the library, this page definition is stored.

YES

If a page definition with the same resource name already exists in the library, this page definition replaces it.

If a page definition with the same resource name does not exist in the library, this page definition is stored.

PELSPERINCH Subcommand

PELSPERINCH *n*

Specifies the Logical Units in pels per inch for this page definition. Use the **PELSPERINCH** parameter to tell PPFA the pel resolution of your printer to generate more exact object placements.

n

Specifies an integer number between 1 and 3,276, which determines the Logical Units in pels per inch.

Note

If the L-Units are not specified on this page definition, they are defaulted to 240 pels per inch.

3

PELSPERINCH example

```
PAGEDEF xmp01 replace yes
  PELSPERINCH 300 ;

PAGEFORMAT P1
  width 7 in
  height 3 in;
PRINTLINE;

PAGEFORMAT P2
  width 7 in
  height 3 in
  PELSPERINCH 1200;
PRINTLINE;
```

In the example above, the page definition xmp01 has specified L-Units as 300 pels per inch. Because the **PAGEFORMAT P1** does not specify L-Units, it inherits 300 pels per inch. **PAGEFORMAT P2** does specify L-Units as 1200 pels per inch.

The width and height in **PAGEFORMAT P1** (7 in, 3 in) produces internal and structured field values of 2100 and 900, whereas in **PAGEFORMAT P2** the same code produces values of 8400 and 3600, because of the difference in L-Units.

TOPMARGIN Subcommand (Record Format and XML)

TOPMARGIN *n* [IN | MM | CM | POINTS | PELS]

Specifies the amount of space to be reserved at the top of the page. The default is 80% of the current line spacing.

BOTMARGIN Subcommand (Record Format and XML)

BOTMARGIN *n* [IN | MM | CM | POINTS | PELS]

Specifies the amount of space to be reserved at the bottom of the page. Only **PAGETRAILER** data can be written into this area. If a graphic has not been ended at the time information is being placed in the bottom margin, the graphic is ended prior to the bottom margin. The default is 0.

LEFTMARGIN Subcommand (Record Format and XML)

LEFTMARGIN *n* [IN | MM | CM | POINTS | PELS]

Specifies the amount of space to be reserved at the left of the page. This is to be used only in conjunction with the **DRAWGRAPHIC**, p. 287 commands. Although PPFA collects the left margin information, it uses the value only within PPFA to define an area. The value itself is not passed in the datastream. The default is **0**.

RIGHTMARGIN Subcommand (Record Format and XML)

```
RIGHTMARGIN n [IN | MM | CM | POINTS | PELS]
```

Specifies the amount of space to be reserved at the right of the page. This is only to be used in conjunction with the **DRAWGRAPHIC**, p. 287 commands. Although PPFA collects the right margin information, it uses the value only within PPFA to define an area. The value itself is not passed in the datastream. The default is **0**.

3

SOSIFONTS Subcommand

```
SOSIFONTS sbcs-font , dbcs-font
```

The **SOSIFONTS** subcommand causes a Single-Byte Character Set (SBCS) font and a Double-Byte Character Set (DBCS) font to be mapped in a manner that will allow the proper font switching when Shift-in and Shift-out control sequences are encountered in printed text.

*sbc*s-font

A Single-Byte Character Set font. This font will be selected by the print server when a Shift-In (SI) control byte is encountered in text being presented.

*dbc*s-font

A Double-Byte Character Set font. This font will be selected by the print server when a Shift-Out (SO) control byte is encountered in text being presented.

There are four ways to use SOSI fonts in a Traditional page definition:

1. In the **PAGEDEF**, using the **FONT** placement subcommand to specify both the SBCS and DBCS fonts to be used. To use this method, define both a single-byte and double-byte font with the **FONT** or **DOFONT** commands. Then reference both fonts on the **FONT** subcommand on the **FIELD**, **PRINTLINE**, and so forth commands, separated by a comma. The single-byte font goes first. For example:

```
Pagedef sosiP1 replace yes;
FONT sb1 GT10 SBCS;
FONT db1 M40F DBCS;
PAGEFORMAT PF1;
PRINTLINE POSITION 1 in 1.2 in FONT sb1,db1;
```

2. In the **PAGEDEF**, using the **PAGEFORMAT** subcommand **SOSIFONTS** to ensure that a single byte font is "mapped" first and a double byte font is "mapped" second in the **PAGEFORMAT**. To use this method, code both a single-byte and double-byte font with the **FONT** command. Then use the **SOSIFONTS** subcommand on the **PAGEFORMAT** command with the desired SBCS font coded first and the desired DBCS font coded next. For example:

```
Pagedef sosiL1 replace yes;
FONT sb1 GT10 SBCS;
FONT db1 M40F DBCS;
PAGEFORMAT PF1 SOSIFONTS sb1,db1;
PRINTLINE POSITION 1 in 1.2 in;
```

 Note

The **SOSIFONTS** subcommand can also be coded on the **PAGEFORMAT** command. Any **PAGEFORMATs** that do not code a **SOSIFONTS** subcommand will inherit from the **PAGEDEF**.

- Specify fonts using the **CHARS** JCL parameter and no fonts in the **PAGEDEF** or no **PAGEDEF** using the default **PAGEDEF**. Using this method the first font defined in the **CHARS** is a SBCS font and the second is a DBCS font.
- Use the **TRCREF** command to defined the SBCS font as 0 and the DBCS font as 1. Do not specify a **FONT** subcommand on **PRINTLINE**, **FIELD**, and other commands when using this method. This method used only with a Traditional page definition. For example:

```
Pagedef sosisl1 replace yes;
  FONT sb1 GT10 SBCS;
  FONT db1 M40F DBCS;
  PAGEFORMAT PF1;
    TRCREF 0 FONT sb1;
    TRCREF 1 FONT db1;
  PRINTLINE;
```

You cannot mix Data Object fonts (defined with the **DOFONT** command) with FOCA fonts (defined with the **FONT** command) in the page definition in any but the first method of specifying SOSI fonts.

There are three ways to use SOSI fonts in a Record Format or XML page definition:

- In the **PAGEDEF**, using the **FONT** placement subcommand to specify both the SBCS and DBCS fonts to be used. To use this method, you define both a single-byte and double-byte font with the **FONT** and **DOFONT** commands. Then you reference both fonts on the **FONT** subcommand on the **FIELD**, **XLAYOUT**, **LAYOUT**, and so forth commands, separated by a comma. The single-byte font goes first. For example:

```
Pagedef sosisl1 replace yes;
  FONT sb1 GT10 SBCS;
  FONT db1 M40F DBCS;
  PAGEFORMAT PF1;
    LAYOUT 'L1' POSITION 1 in 1.2 in FONT sb1,db1;
```

- In the **PAGEDEF**, using the **PAGEFORMAT** subcommand **SOSIFONTS** to insure that a single byte font is "mapped" first and a double byte font is "mapped" second in the **PAGEFORMAT**. To use this method, code both a single-byte and double-byte font with the **FONT** command. Then you use the **SOSIFONTS** subcommand on the **PAGEFORMAT** command with the desired SBCS font coded first and the desired DBCS font coded next. For example:

```
Pagedef sosisl1 replace yes;
  FONT sb1 GT10 SBCS;
  FONT db1 M40F DBCS;
  PAGEFORMAT PF1 SOSIFONTS sb1,db1;

  LAYOUT 'L1' POSITION 1 in 1.2 in;
```

 Note

The **SOSIFONTS** subcommand can also be coded on the **PAGEFORMAT** command. Any **PAGEFORMATs** that do not code a **SOSIFONTS** subcommand will inherit from the **PAGEDEF**.

- Define fonts using the **CHARS** and no fonts in the **PAGEDEF** or no **PAGEDEF** using the default **PAGEDEF**. Using this method the first font defined in the **CHARS** is a SBCS font and the second is a DBCS font.

You cannot mix Data Object fonts (defined with the **DOFONT** command) with normal FOCA fonts (defined with the **FONT** command) in the page definition in any but the first method of specifying SOSI fonts. That is only when you specify both fonts on the placement command.

UDType Subcommand

UDType {EBCDIC | ASCII | UTF8 | UTF16}

Identifies the encoding of your data.

EBCDIC

Single-byte EBCDIC code page 500. This is the default value for XML page definitions on z/OS.

ASCII

Single-byte ASCII code page 819. This is the default value for XML page definitions on Windows.

UTF8

Unicode encoding form UTF-8 toleration mode (surrogates are allowed).

UTF16

Unicode encoding form UTF-16.

Note

The **PAGEDEF** is created in UTF-16BE (Big Endian). If the data is in UTF16LE, PSF translates it to UTF-16BE before processing.

For traditional and record format page definitions, there is no default value. This means that no data type information is added to the page definition.

UDType on the **PAGEDEF** command is used for several things:

1. To allow PPFA to translate fixed text to the specified **UDType** from either ASCII or EBCDIC according to the platform on which the PPFA compile is done.
2. To set the default for all **DOFONT** (Data Object Font) commands so you do not have to code **UDType** on each **DOFONT** command.
3. To pass encoding information to the printer for converting non-UTF16 user data to UTF16 when using a **DOFONT** command. (True Type is an example of a **DOFONT**).
4. To allow PSF or ACIF to know to look for a Byte Order Mark (BOM) when your data type is UTF8 or UTF16 and contains a BOM.

If the data does not match the platform data type, PPFA translates the following constant page definition data to the encoding specified by **UDType**:

- **FIELD** command text (all page definitions)
- **CONDITION** text (all page definitions)
- **LAYOUT** command 'record ID' (Record Format page definition only)
- **LAYOUT** command delimiter (Record Format page definition only)
- **XLAYOUT** command starttags (XML page definition only)
- **XLAYOUT** command delimiter (XML page definition only)
- **DEFINE QTAG** command start tags (XML page definition only)

- **FIELD** attribute names (XML page definition only)

Note

1. For data with a Byte Order Mark (BOM), you must specify **UDType**, and the BOM must be the first two bytes (**UTF16**) or three bytes (**UTF8**) in the first line data record following any CC or TRC bytes. A BOM in the data is required if the data is **UTF16** Little Endian.
2. If the **UDType** parameter is specified, all of the user data processed by this page definition must be of that data type. Having data that is not of the specified encoding type could lead to improper translation of that data which would, for example, not allow the text in a **CONDITION** statement to be matched to the data.
3. If **UDType** is not coded on the **PAGEDEF**, then the **UDType** on the **DOFONT** command or **TYPE** on the **FONT** command determines the translation, but only for the data placed by that font.
4. If you have multiple data type encodings in a data file, you must not code **UDType** on the page definition. Instead, for Data Objects Fonts, code **UDType** on the **DOFONT** command for the fonts that place the individual fields or records. And for regular FOCA fonts, you use fonts of the type matching the data for the individual fields or records.
5. If you use ACIF to generate your print document and the **NEWLINE ENCODING** value does not agree with the **UDType** subcommand on the **PAGEDEF** command, ACIF issues a warning message but continues processing the file.
6. The **UDType** coded on the **PAGEDEF** is inherited by the **DOFONT** if **NONE** is coded on the **DOFONT** command. And, if no **UDType** is coded on either the **PAGEDEF** or the **DOFONT**, the **DOFONT** defaults to the platform encoding.
7. The **UDType** coded or not coded on the **PAGEDEF** does not affect the **FONT** command inheritance of data type, or in any way except to provide translation for fixed text being placed by the **FONT** command.
8. If **UDType** is not the same as the **UDType** coded on the **DOFONT** command, PPFA issues an error message and no page definition is generated.
9. To use multiple font mappings for a line in **ASCII**, **UTF8**, or **UTF16** you must use the **FIELD** command, since automatic font switching for single and double byte text is only done for EBCDIC data.
10. **SBCS**, **DBCS**, **TYPE**, and **UDTYPE** are different parameters that can affect fonts. **TYPE** indicates this is an ASCII or EBCDIC font being defined to use for printing. **UDTYPE**, which is not on the **FONT** command, indicates this is the type of the user's data, ASCII or EBCDIC. **SBCS** and **DBCS** indicate what type of character set the defined font uses, single byte (**SBCS**) or double byte (**DBCS**).
11. If **UDTYPE** is coded on the **PAGEDEF** and an ID name or text is explicitly defined with another type, an error results and the page definition is not generated. In the next example:

```
PAGEDEF cmrlis replace yes UDTYPE ASCII;
FONT varb gt10;
SETUNITS LINESP .25 in;
PAGEFORMAT rept1 TOPMARGIN .25 in BOTMARGIN .25 in;
LAYOUT E'startpage' BODY NEWPAGE POSITION .25 in NEXT font varb;
```

For **PAGEDEF** with **UDTYPE ASCII** and **LAYOUT** with **E'startpage'**, the **ASCII** type does not match the **'E'** (EBCDIC) type.

RECIDLEN Subcommand (Record Format)

RECIDLEN 10 | *n*

Specifies the length of the Record Descriptor ID in bytes. The Record Descriptor ID is also known as the "LAYOUT name". If the **RECIDLEN** parameter is not coded on a **PAGEFORMAT** command, it inherits the value from the specified or default value on the page definition. If the **RECIDLEN** parameter is not coded on a **PAGEDEF** command, the default length is 10 bytes.

n

Specifies that the record ID on the **LAYOUT** command is to be *n* bytes long. The allowable value of *n* is 1 to 250. UTF-16 data characters are 2 bytes long, allowing up to 125 UTF-16 characters. Any record ID on a **LAYOUT** command that is less than this length is padded to the specified length with blanks of the type specified or defaulted in the **UDType** subcommand on the **PAGEDEF** command. A record ID that is longer than *n* is flagged as an error by PPFA and no page definition is generated.

Note

If the User Data Type (**UDType**) is **UTF16** and *n* is odd, it is rounded up to the next even number.

Code Example

In the following example, User Data Type **UTF16** and **RECIDLEN 24** are specified on the **PAGEDEF** command and the **RECIDLEN 26** is specified on the second **PAGEFORMAT** command (pf2).

For the two page formats pf1 and pf2.

1. pf1 inherits a **RECIDLEN** of 24 bytes from the page definition, and the User Data Type for the entire page definition is UTF-16.
 - 1) The **LAYOUT** name Long Name 1 is translated to UTF-16 and padded to 24 bytes with UTF-16.
 - 2) The delimiter / (slash) on the **LAYOUT** is translated to UTF-16.
 - 3) The **FIELD** command text abcd is translated to UTF-16.
2. pf2 specifies a **RECIDLEN** of 26 bytes and gets **UDType** UTF-16 from the page definition.
 - 1) The **LAYOUT** name Long Name 2 is translated to UTF-16 and padded to 26 bytes with UTF-16.
 - 2) The **CONDITION** command text ABCDEFGH is translated to UTF-16. Note that the field length of the 8 character string is 16 bytes because each character is 2 bytes long.

```
PAGEDEF xmp1 UDType UTF16 RECIDLEN 24 REPLACE yes;

FONT comp a075nc TYPE UNICODE
FONT comp2 a075bg TYPE UNICODE

PAGEFORMAT pf1;
  LAYOUT 'Long Name 1' DELIMITER '/' Position 2 1 FONT comp;
  FIELD TEXT 'abcd' Position 2.5 1.5;

PAGEFORMAT pf2 RECIDLEN 26;
  LAYOUT 'Long Name 2' POSITION 2 1 FONT comp2;
  CONDITION cn1 START 13 Length 16
  WHEN EQ 'ABCDEFGH' NULL Pageformat pf1;
```

PAGEFORMAT Command

```

PAGEFORMAT name
[WIDTH n [unit]]
[HEIGHT n [unit]]
[LINEONE x-pos y-pos]
[DIRECTION {ACROSS | DOWN | BACK | UP}]
[PELSPERINCH n]
[TOPMARGIN n [IN | MM | CM | POINTS | PELS]]
[BOTMARGIN n [IN | MM | CM | POINTS | PELS]]
[LEFTMARGIN n [IN | MM | CM | POINTS | PELS]]
[RIGHTMARGIN n [IN | MM | CM | POINTS | PELS]]
[PAGECOUNT [CONTINUE [n | 1] | STOP | RESUME [n] | RESET [n | 1]]
  [CMP] [CCP]]
[SOSIFONTS sbc-font , dbc-font]
[RECIDLEN n];

```

Note

1. The **LINEONE** subcommand is valid only for traditional page definitions.
2. The **TOPMARGIN**, **BOTMARGIN**, **LEFTMARGIN**, **RIGHTMARGIN**, and **PAGECOUNT** subcommands are valid only for record format and XML page definitions.
3. The **RECIDLEN** subcommand is valid only for record format page definitions.

Page formats are subsets of page definitions. If you want to use more than one set of specifications to format a page within a single print job, you must use more than one page format. To change page formats, use conditional processing or insert an Invoke Data Map structured field in your print file. (Page formats are known to the print server as data maps.) If you do not use conditional processing or if you do not insert an Invoke Data Map structured field, the print server uses only the first page format in the page definition. Page formats are placed in the page definition in the order in which they are generated.

Except for **PAGECOUNT**, **PAGEFORMAT** subcommands have no fixed defaults. The **PAGEFORMAT** command and its subcommands can assume defaults. If any **PAGEFORMAT** subcommand is omitted, its value is selected from the corresponding subcommand in the governing **PAGEDEF**, p. 389 command.

The **PAGEFORMAT** command can be omitted if only one page format is used in a page definition. If omitted, PPSA assigns a page format name by using the page-definition name, including the 'P1' prefix.

PAGEFORMAT *name*

Specifies an alphanumeric name of 1 to 8 characters. This name must be unique within the page definition.

The following subcommands are used for each page format. They may be issued in the same way as in a page definition. Values specified in the **PAGEDEF** subcommands are used if any of the following subcommands are not defined within a page format.

Subcommands

WIDTH Subcommand

```
WIDTH n [unit]
```

Defines the width of the logical page.

n

A number with up to three decimal places is used. The width may vary according to the type of printer being used. For more information, refer to your printer documentation.

unit

Specifies a unit of measurement for the **WIDTH** subcommand. The choices are **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

HEIGHT Subcommand

```
[HEIGHT n [unit]]
```

Defines the height of the logical page.

n

A number with up to three decimal places is used. The height may vary according to the type of printer being used. For more information, refer to your printer documentation.

unit

Specifies a unit of measurement for the **HEIGHT** parameter. The choices are **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

LINEONE Subcommand (Traditional)

```
LINEONE x-pos y-pos
```

Specifies the values for the **MARGIN** and **TOP** parameters used in the **POSITION** subcommand of the **PRINTLINE** command.

x-pos

Specifies the offset from the left edge of the logical page (margin position). The valid options for *x-pos* are described in the **SETUNITS** command for the horizontal value.

y-pos

Specifies the offset from the top of the logical page (top line position). The valid options for *y-pos* are described in the **SETUNITS** command for the vertical value.

DIRECTION Subcommand

```
DIRECTION {ACROSS | DOWN | BACK | UP}
```

Specifies the print direction of the logical page. Not all printers can print in all print directions. For more information, refer to your printer documentation.

↓ Note

Some printers have a different form origin and require different direction settings than most page printers. For printing in the landscape page presentation when using wide forms, the **PRESENT** subcommand must be specified on the **FORMDEF** command to produce readable output. Alternatively, if you have existing page definitions, the UP direction can be used in the page definition without changes to the form definition to produce the same result.

ACROSS

The page is printed with the characters added to the page from *left to right*, and the lines added from the top to the bottom.

DOWN

The page is printed with the characters added to the page from *top to bottom*, and the lines added from the right to the left.

BACK

The page is printed with the characters added to the page from *right to left*, and the lines added from the bottom to the top.

UP

The page is printed with the characters added to the page from *bottom to top*, and the lines added from the left to the right.

For Record Format and XML, **DIRECTION** affects the meaning of the following new margin parameters:

- If the **DIRECTION** is **ACROSS**, then **TOPMARGIN** refers to the margin in the short end of the physical page where the tops of the characters point toward that same short end.
- If the **DIRECTION** is **DOWN**, then **TOPMARGIN** refers to the margin in the long end of the physical page where the tops of the characters point toward that same long end.

PELSPERINCH Subcommand

PELSPERINCH *n*

Specifies the Logical Units in pels per inch for this page format. Use the **PELSPERINCH** parameter to tell PPFA the pel resolution of your printer to generate more exact object placements.

n

Specifies an integer number between 1 and 3,276, which determines the Logical Units in pels per inch.

TOPMARGIN Subcommand (Record Format and XML)

TOPMARGIN *n* [**IN** | **MM** | **CM** | **POINTS** | **PELS**]

This keyword specifies the amount of space to be reserved at the top of the page.

BOTMARGIN Subcommand (Record Format and XML)

BOTMARGIN *n* [**IN** | **MM** | **CM** | **POINTS** | **PELS**]

This keyword specifies the amount of space to be reserved at the bottom of the page.

LEFTMARGIN Subcommand (Record Format and XML)

LEFTMARGIN *n* [**IN** | **MM** | **CM** | **POINTS** | **PELS**]

This keyword specifies the amount of space to be reserved at the left of the page. This is only used in conjunction with the **DRAWGRAPHIC** commands. Although PPFA collects the left margin information, the value is used only within PPFA to define an area. The value itself is not passed in the datastream.

RIGHTMARGIN Subcommand (Record Format and XML)

RIGHTMARGIN *n* [**IN** | **MM** | **CM** | **POINTS** | **PELS**]

This keyword specifies the amount of space to be reserved at the right of the page. This is only to be used in conjunction with the **DRAWGRAPHIC** commands. Although PPFA collects the right margin

information, it uses the value only within PPFA to define an area. This value itself is not passed in the datastream.

PAGECOUNT Subcommand (Record Format and XML)

```
PAGECOUNT [CONTINUE [n | 1] | STOP | RESUME [n] | RESET [n | 1]]
[CMP] [CCP]
```

This keyword allows the user to specify how the page counting is to be handled when switching between page formats.

CONTINUE

Page counting continues from the previous page format. This is the default. The *n* value is only used on the first **PAGEFORMAT** in the job, otherwise it is ignored. If this is the first **PAGEFORMAT** and no *n* value is specified, it defaults to **1**.

STOP

Page counting stops. Page count is captured from the previous page format, but does not continue to count.

RESUME

Page counting continues from wherever it was the last time this page format was called. The *n* value sets the value only the first time page format is invoked.

RESET

Page counting is reset to the *n* value. If no *n* value is entered, then the page numbers are reset to **1**.

CMP

Count MO:DCA Pages option. Tells the print server to count any imbedded MO:DCA pages in the page count.

CCP

Count Constant Pages options. Tells the print server to count any pages that have no variable data on them.

SOSIFONTS Subcommand

```
SOSIFONTS sbcs-font , dbcs-font
```

The **SOSIFONTS** subcommand causes a Single-Byte Character Set (SBCS) font and a Double-Byte Character Set (DBCS) font to be mapped in a manner that will allow the proper font switching when Shift-in and Shift-out control sequences are encountered in printed text.

*sbc*s-font

A Single-Byte Character Set font. This font will be selected by the print server when a Shift-In (SI) control byte is encountered in text being presented.

*dbc*s-font

A Double-Byte Character Set font. This font will be selected by the print server when a Shift-Out (SO) control byte is encountered in text being presented.

There are four ways to use SOSI fonts in a Traditional page definition:

1. In the **PAGEDEF**, using the **FONT** placement subcommand to specify both the SBCS and DBCS fonts to be used. To use this method, you define both a single-byte and double-byte font with the **FONT** and **DOFONT** commands. Then you reference both fonts on the **FONT** subcommand on the **FIELD**, **PRINTLINE**, **LAYOUT**, and so forth commands, separated by a comma. The single-byte font goes first. For example:

```
Pagedef sosiP1 replace yes;
  FONT sb1 GT10 SBCS;
  FONT db1 M40F DBCS;
  PAGEFORMAT PF1;
  PRINTLINE POSITION 1 in 1.2 in FONT sb1,db1;
```

2. In the **PAGEDEF**, using the **PAGEFORMAT** subcommand **SOSIFONTS** to insure that a single byte font is "mapped" first and a double byte font is "mapped" second in the **PAGEFORMAT**. To use this method, code both a single-byte and double-byte font with the **FONT** command. Then you use the **SOSIFONTS** subcommand on the **PAGEFORMAT** command with the desired SBCS font coded first and the desired DBCS font coded next. For example:

```
Pagedef sosiL1 replace yes;
  FONT sb1 GT10 SBCS;
  FONT db1 M40F DBCS;
  PAGEFORMAT PF1 SOSIFONTS sb1,db1;

  PRINTLINE POSITION 1 in 1.2 in;
```

 **Note**

The **SOSIFONTS** subcommand can also be coded on the **PAGEDEF** command. It will be inherited on any **PAGEFORMATs** that do not code a **SOSIFONTS** subcommand.

3. Define fonts using the **CHARS** and no fonts in the **PAGEDEF** or no **PAGEDEF** using the default **PAGEDEF**. Using this method the first font defined in the **CHARS** is a SBCS font and the second is a DBCS font.
4. **Traditional Only:** Use the **TRCREF** command to define the SBCS font as 0 and the DBCS font as 1. Do not specify a **FONT** subcommand on the **PRINTLINE**, **FIELD**, and so forth commands, when using this method. This method is for use with a traditional page definition only. For example:

```
Pagedef sosiL1 replace yes;
  FONT sb1 GT10 SBCS;
  FONT db1 M40F DBCS;
  PAGEFORMAT PF1;
  TRCREF 0 FONT sb1;
  TRCREF 1 FONT db1;
  PRINTLINE;
```

You cannot mix Data Object fonts (defined with the **DOFONT** command) with normal FOCA fonts (defined with the **FONT** command) in the page definition in any but the first method of specifying SOSI fonts. That is only when you specify both fonts on the placement command.

There are three ways to use SOSI fonts in a Record Format or XML page definition:

1. In the **PAGEDEF**, using the **FONT** placement subcommand to specify both the SBCS and DBCS fonts to be used. To use this method, you define both a single-byte and double-byte font with the **FONT** and **DOFONT** commands. Then you reference both fonts on the **FONT** subcommand on the **FIELD**, **PRINTLINE**, **LAYOUT**, and so forth commands, separated by a comma. The single-byte font goes first. For example:

```
Pagedef sosiP1 replace yes;
```

```

FONT sb1 GT10 SBCS;
FONT db1 M40F DBCS;
PAGEFORMAT PF1;
LAYOUT 'L1' POSITION 1 in 1.2 in FONT sb1,db1;

```

- In the **PAGEDEF**, using the **PAGEFORMAT** subcommand **SOSIFONTS** to insure that a single byte font is “mapped” first and a double byte font is “mapped” second in the **PAGEFORMAT**. To use this method, code both a single-byte and double-byte font with the **FONT** command. Then you use the **SOSIFONTS** subcommand on the **PAGEFORMAT** command with the desired SBCS font coded first and the desired DBCS font coded next. For example:

```

Pagedef sosisl1 replace yes;
FONT sb1 GT10 SBCS;
FONT db1 M40F DBCS;
PAGEFORMAT PF1 SOSIFONTS sb1,db1;

LAYOUT 'L1' POSITION 1 in 1.2 in;

```

Note

The **SOSIFONTS** subcommand can also be coded on the **PAGEDEF** command. It will be inherited on any **PAGEFORMATs** that do not code a **SOSIFONTS** subcommand.

- Define fonts using the **CHARS** and no fonts in the **PAGEDEF** or no **PAGEDEF** using the default **PAGEDEF**. Using this method the first font defined in the **CHARS** is a SBCS font and the second is a DBCS font.
- Use the **TRCREF** command to define the SBCS font as 0 and the DBCS font as 1. Do not specify a **FONT** subcommand on the **LAYOUT**, **FIELD**, and so forth commands, when using this method. This method is for use with a traditional page definition only. For example:

```

Pagedef sosisl1 replace yes;
FONT sb1 GT10 SBCS;
FONT db1 M40F DBCS;
PAGEFORMAT PF1;
TRCREF 0 FONT sb1;
TRCREF 1 FONT db1;
LAYOUT 'L2';

```

You cannot mix Data Object fonts (defined with the **DOFONT** command) with normal FOCA fonts (defined with the **FONT** command) in the page definition in any but the first method of specifying SOSI fonts. That is only when you specify both fonts on the placement command.

For additional information about using SOSI characters, see the *AFP Programming Guide and Line Data Reference*, S544-3884.

RECIDLEN Subcommand (Record Format)

RECIDLEN *n*

Specifies the length of the Record Descriptor ID in bytes. The Record Descriptor ID is also known as the “LAYOUT name”. If the **RECIDLEN** parameter is not coded on a **PAGEFORMAT** command, it inherits the value from the specified or default value on the page definition. If the **RECIDLEN** parameter is not coded on a **PAGEDEF** command, the default length is 10 bytes.

Note

If the User Data Type (**UDType**) is **UTF16** and *n* is odd, it is rounded up to the next even number.

n

Specifies that the record ID on the **LAYOUT** command is to be n bytes long. The allowable value of n is 1 to 250. UTF-16 data characters are 2 bytes long, allowing up to 125 UTF-16 characters. Any record ID on a **LAYOUT** command that is less than this length is padded to the specified length with blanks of the type specified or defaulted in the **UDType** subcommand on the **PAGEDEF** command. A record ID that is longer than n is flagged as an error by PPFA and no page definition is generated.

Note

If the User Data Type (**UDType**) is **UTF16** and n is odd, it is rounded up to the next even number.

Code Example

3

In the following example, User Data Type **UTF16** and **RECIDLEN 24** are specified on the **PAGEDEF** command and the **RECIDLEN 26** is specified on the second **PAGEFORMAT** command (pf2).

For the two page formats pf1 and pf2:

1. pf1 inherits a **RECIDLEN** of 24 bytes from the page definition, and the User Data Type for the entire page definition is UTF-16.
 - 1) The **LAYOUT** name Long Name 1 is translated to UTF-16 and padded to 24 bytes with UTF-16.
 - 2) The delimiter / (slash) on the **LAYOUT** is translated to UTF-16.
 - 3) The **FIELD** command text abcd is translated to UTF-16.
2. pf2 specifies a **RECIDLEN** fo 26 bytes and gets **UDType** UTF-16 from the page definition.
 - 1) The **LAYOUT** name Long Name 2 is translated to UTF-16 and padded to 26 bytes with UTF-16.
 - 2) The **CONDITION** command text ABCDEFGH is translated to UTF-16. Note that the field length of the 8 character string is 16 bytes because each character is 2 bytes long.

```
PAGEDEF xmp1 UDType UTF16 RECIDLEN 24 REPLACE yes;

FONT comp a075nc TYPE UNICODE
FONT comp2 a075bg TYPE UNICODE

PAGEFORMAT pf1;
  LAYOUT 'Long Name 1' DELIMITER '/' Position 2 1 FONT comp;
  FIELD TEXT 'abcd' Position 2.5 1.5;

PAGEFORMAT pf2 RECIDLEN 26;
  LAYOUT 'Long Name 2' POSITION 2 1 FONT comp2;
  CONDITION cn1 START 13 Length 16
  WHEN EQ 'ABCDEFGH' NULL Pageformat pf1;
```

PRINTLINE Command (Traditional)

```
PRINTLINE
[REPEAT  $n$  {FIELD | LINE}]
[CHANNEL  $n$ ]
[FONT  $name1$  [,  $name2$ ]]
[PRINTDATA {YES | NO}]
[POSITION {MARGIN | SAME |  $x-pos$ } [RELATIVE] {TOP | NEXT | SAME |  $y-pos$ }]
```

```
[COLOR colorname |
  RGB rvalue gvalue bvalue |
  HIGHLIGHT hvalue] [COVERAGE cvalue] [BLACK bvalue] |
  CMYK cvalue mvalue yvalue kvalue |
  CIELAB lvalue [(-)] clvalue [(-)] c2value]
[OVERLAY {Xname | VARIABLE [START n] LENGTH n}
  [0 0 | rel. x-pos rel. y-pos]
  [OVROTATE {0 | 90 | 180 | 270}]]
[SEGMENT {Xname | VARIABLE [START n] LENGTH n}
  [0 0 rel. x-pos rel. y-pos]]
[DIRECTION {ACROSS | DOWN | BACK | UP}]
[OBJECT {lname [0 0 | relX relY] |
  VARIABLE [START n] LENGTH n [0 0 | relX relY] OBTYP E Parameters}
  Other OBJECT Parameters] ;
```

OBTYP E Parameters

```
OBTYP E {PSEG | IOCA | BCOCA | GOCA | PTOCA |
  OTHER OBID {comp-id | type-name}}
```

Other OBJECT Parameters

```
[OBSIZE {USEOBJ | wd [unit] hg [unit]}]
[OBMAP {LEFT | TRIM | FIT | CENTER | REPEAT | FILL}]
[OBCHPOS {USEOBJ | x-pos}]
[OBCVPOS {USEOBJ | y-pos}]
[OBROTATE {0 | 90 | 180 | 270}]
[OBCOLOR color-name]
[OBPAGE n]
[OBRESOLUTION x-res y-res {IN | CM}]
[OBCPSS PSS]
```

PRINTLINE

The **PRINTLINE** command specifies the printing of one data record on a line. If a *formatted* printline is to be printed, one or more **FIELD** commands must follow the governing **PRINTLINE** command; at least one is required. If this is not done, field processing is not performed and the unformatted data is printed.

Note

1. The **PRINTLINE** command defines a traditional page definition. **PRINTLINE** commands cannot be mixed with **LAYOUT** commands, which define Record Formatting page definitions, or with **XLAYOUT** commands, which define XML page definitions.
2. If this **PRINTLINE** is followed by several **FIELD** commands, the related field controls are also repeated.

Subcommands

REPEAT Subcommand

```
REPEAT n {FIELD | LINE}
```

Specifies the number of printlines that are to be printed on a logical page. The direction and font specified within this printline applies to all lines printed. By using this command, you do not have to write specifications for each line.

Note

If the **REPEAT** subcommand is omitted, only one line is printed for this **PRINTLINE** command.

n

This value specifies the number of printlines for a logical page; the maximum value is 65,535.

0

Not valid

1

Only one line is printed

FIELD

Specifies that fields associated with repetitions of this **PRINTLINE** are to be positioned based on the first instance of the same field.

This parameter has no effect in fields with the same direction as the **PRINTLINE** of which they are a part.

This parameter specifies that the direction of repetition for a given field is the direction of the first instance of this field, plus 90°. Therefore, every field of an **ACROSS PRINTLINE** is repeated down the page, *regardless of the direction of the FIELD*.

LINE

Specifies that fields associated with repetitions of this printline are to be positioned based on the repetition of the **PRINTLINE** itself.

This parameter has no effect in fields with the same direction as the **PRINTLINE** of which they are a part.

This parameter specifies that the direction of repetition for a given field is the direction of the associated **PRINTLINE** plus 90°. Therefore, every field of an **ACROSS PRINTLINE** is repeated down the page, *regardless of the direction of the FIELD*.

CHANNEL Subcommand

CHANNEL *n*

Used to specify line spacing, skipping within a logical page, or page ejection (skipping to a new page). This subcommand is equivalent to the Forms Control Buffer (FCB) channel. The **CHANNEL** subcommand applies only to the first printline.

n

The range of channels is 1 to 12. These correspond to carriage-control characters in the data. There is no default.

FONT Subcommand

FONT *name1* [, *name2*]

Defines the font to be used for the printline.

name1

Specifies the name of a font used to print the data. This font must have been defined in a previous **FONT**, p. 347 command in this page definition.

If Shift-Out, Shift-In (SOSI) processing is used, *name1* must be the single-byte font.

name2

Specify only when using Shift-Out, Shift-In (SOSI) processing to dynamically switch between a single-byte font and a double-byte font within the printline. *name2* must be the double-byte font.

↓ Note

1. If this subcommand is not specified and TRC (Table Reference Character) bytes are specified in the print data, the print server uses the font indicated by the TRC byte. Otherwise, the print server selects a default font.
2. For **ASCII**, **UTF8**, or **UTF16** the entire **PRINTLINE** command must be one font. To use multiple font mappings for a line in **ASCII**, **UTF8**, or **UTF16** you must use the **FIELD** command.

PRINTDATA Subcommand

```
PRINTDATA {YES | NO}
```

Specifies whether the line of data associated with the current **PRINTLINE** should be printed. The **PRINTDATA** subcommand is useful when the data stream is interspersed with lines of comments, blank lines, or lines without data that are not meant to be printed.

YES

Specifies the data for the current **PRINTLINE** is printed. **YES** is the default.

NO

Specifies the data for the current **PRINTLINE** is not printed.

↓ Note

1. Any **FIELD** command that is associated with a **PRINTLINE** that specifies **PRINTDATA NO** is ignored and an error message is issued.
2. The default position for a command that specifies **PRINTDATA NO** is **POSITION SAME SAME**.

PRINTLINE NO Example

```
PAGEDEF xmp01 ;
SETUNITS LINESP 1 LPI ;

PRINTLINE ;
PRINTLINE PrintData NO ;
PRINTLINE PrintData yes ;
PRINTLINE ;
PRINTLINE Segment X PrintData NO Overlay Y Position Same Next ;
PRINTLINE PrintData yes ;
```

In Figure [PRINTLINE NO Example, p. 408](#), the **LINESP** parameter specifies that one line per inch is to be printed.

1. The first line of data is read and printed.
2. The second line of data is read, but not printed.

Note

Line 2 does not affect the positioning of the lines that follow. Line 3 is positioned as though line 2 did not exist.

3. The third line of data is read and printed one inch down from the first line.
4. The fourth line of data is read and printed one inch down from the third line.
5. The fifth line of data is read, but not printed.
 - The segment X is printed.
 - The overlay Y is printed.
6. The sixth line of data is read and printed two inches down from the fourth line.

3

POSITION Subcommand

```
POSITION {MARGIN | SAME | x-pos} [RELATIVE] {TOP | NEXT | SAME | y-pos}
```

Specifies the starting position of the printline in the printout. The **POSITION** subcommand applies only to the first printline.

MARGIN

Specifies that this line starts at the position specified as the horizontal (*x*) value in the previous **LINEONE** subcommand within this page definition.

SAME

Specifies that this line starts at the same horizontal offset position as the previous printline. If applied to the first printline of a logical page, the horizontal position is **0**, which is the default.

=

Alternate for **SAME**.

x-pos

Specifies the horizontal offset from the left side of the logical page. The value is a number with up to three decimal places. The valid options for *x-pos* are described in the **SETUNITS** command for the horizontal value.

RELATIVE

Specifies that the following vertical position value is to be processed as a relative value. The printline is positioned relative to the last printline placed on the page.

If a set of printlines were skipped over in the page definition because of a skip-to-channel carriage control, and the new active printline contains a relative vertical position, the output line is positioned relative to the location of the last line printed on the page.

↓ Note

1. If both **TOP** and **RELATIVE** are requested for the Y position value, the **RELATIVE** request is ignored.
2. When using **RELATIVE** positioning, PPFA does not flag off-the-page conditions for the position of a printline or for any overlays, segments or objects placed relative to that printline. Printlines that fall outside the bounds of the logical page are flagged by the print server at run time.
3. When specifying **RELATIVE**, use the minus sign to indicate any negative values for the **PRINTLINE** vertical position; you may use the plus sign to indicate positive values. If no sign is used, a positive value is assumed.
4. The **DIRECTION** for a relative printline must be **ACROSS**. Fields associated with a relative printline must have the same **DIRECTION** as the printline and must match the **PAGEFORMAT DIRECTION**.
5. If **RELATIVE** is specified with **SAME** as the y value, the relative value in the printline is +0.
6. Relative positioning is allowed on a **PRINTLINE** command only if the **PRINTLINE** and all its associated **FIELD** commands are formatted to print in the same direction as the **PAGEFORMAT**. That is, the **DIRECTION** parameter in the **PRINTLINE** and any associated **FIELD** commands must specify (or default to) **ACROSS**. The **DIRECTION** in the **PAGEFORMAT** or **PAGEDEF** command may be any allowable value: **ACROSS**, **DOWN**, **BACK**, or **UP**.
7. The **PRINTLINE** command in which relative positioning is used can specify a **CHANNEL** parameter. The *n* value specified for the **CHANNEL** parameter cannot be used for any other **PRINTLINE** in the same **PAGEFORMAT**.

TOP

Specifies that the printline is placed in the position specified as the vertical (*y*) value in the previous **LINEONE** subcommand within this page definition.

NEXT

Specifies that the **PRINTLINE** is to be positioned down (on the logical page) one line (as defined in the **LINESP** subcommand of the last **SETUNITS**, p. 425 command) from the previous **PRINTLINE**. The **LINESP** subcommand of the **SETUNITS** command establishes the distance from one line to the next.

When **NEXT** is specified for the first **PRINTLINE** of a logical page, the starting position of the line is one line down from the top of the logical page, which is the default.

↓ Note

The “down” direction is determined by the direction of the logical page (as specified in the page format), not the printline direction. **NEXT** is, therefore, mainly useful in **ACROSS** printlines.

SAME

Specifies that this printline starts at the same vertical position as the previous printline. If applied to the first printline of a logical page, the horizontal position is **0**, which is the default.

=

Alternate for **SAME**.*y-pos*

Specifies the vertical offset from the top side of the logical page. The value options for *y-pos* are described in the **SETUNITS** command for the vertical value.

POSITION Example

```
setunits linesp 6 lpi;
PAGEDEF rel9 replace yes
  direction across width 8.5 in height 11.0 in;
PRINTLINE channel 1 repeat 7 position 0 IN 1.0 IN;

/* The fields will be placed at +120 pels, +24 pels (next) */
/* and +48 pels (.20 IN) from lines previously placed on page */

setunits linesp 10 lpi;
PRINTLINE channel 2 repeat 2 position 0 relative next;
  FIELD START 1 LENGTH 3 position 0 IN .5 IN;
  FIELD START 4 LENGTH 3 position 0 IN next;
  FIELD START 7 LENGTH 3 position current .20 IN;
```

COLOR Subcommand

COLOR *colorname*

Specifies an OCA or defined color for the text of this field. This subcommand is recognized only by printers that support multiple-color printing. Refer to your printer publication for information about the colors that can be printed.

Note

See [AFP Color Management, p. 164](#) for more information about using color.

colorname

Values for *colorname* can be a defined color (see [DEFINE COLOR Command, p. 279](#)), or an OCA *colorname*. Values for OCA *colornames* are:

NONE
DEFAULT
BLACK
BLUE
BROWN
GREEN
RED
PINK (or **MAGENTA**)
TURQ (or **CYAN**)
YELLOW
DARKBLUE (or **DBLUE**)
ORANGE
PURPLE
MUSTARD
GRAY

DARKGREEN (or **DGREEN**)**DARKTURQ** (**DTURQ**, or **DCYAN**, or **DARKCYAN**)

The color choices depend on the printer.

If you do not enter one of these colors, the default color for that printer is used. **NONE** is the color of the medium. **DEFAULT** is the printer default color.

Note

In some printer manuals, the color turquoise (**TURQ**) is called "cyan", and the color pink (**PINK**) is called "magenta".

PPFA supports the following synonyms:

- **CYAN** for **TURQ**
- **DARKCYAN** for **DARKTURQ**
- **DBLUE** for **DARKBLUE**
- **DCYAN** for **DARKTURQ**
- **DGREEN** for **DARKGREEN**
- **DTURQ** for **DARKTURQ**
- **MAGENTA** for **PINK**

Note

Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **FIELD** or **PRINTLINE** command. The output is device dependent and may not be what you expect.

Color Model Subcommands

```
[RGB rvalue gvalue bvalue |
HIGHLIGHT hvalue] [COVERAGE cvalue] [BLACK bvalue] |
CMYK cvalue mvalue yvalue kvalue |
CIELAB lvalue [(-)] clvalue [(-)] c2value]
```

These subcommands specify the color of print for this field supported in MO:DCA for the Red/Green/Blue color model (**RGB**), the highlight color space, the Cyan/Magenta/Yellow/Black color model (**CMYK**), and the **CIELAB** color model.

RGB *rvalue gvalue bvalue*

Three **RGB** integer values are used. The first (*rvalue*) represents a value for red, the second (*gvalue*) represents a value for green, and the third (*bvalue*) represents a value for blue. Each of the three integer values may be specified as a percentage from 0 to 100.

Note

An **RGB** specification of 0/0/0 is black. An **RGB** specification of 100/100/100 is white. Any other value is a color somewhere between black and white, depending on the output device.

HIGHLIGHT *hvalue* [**COVERAGE** *cvalue*] [**BLACK** *bvalue*]

Indicates the highlight color model. Highlight colors are device dependent.

You can use an integer within the range of 0 to 65535 for the *hvalue*.

↓ Note

An *hvalue* of 0 indicates that there is no default value defined; therefore, the default color of the presentation device is used.

COVERAGE indicates the amount of coverage of the highlight color to be used. You can use an integer within the range of 0 to 100 for the *cvalue*. If less than 100 percent is specified, the remaining coverage is achieved with the color of the medium.

↓ Note

Fractional values are ignored. If **COVERAGE** is not specified, a value of 100 is used as a default.

BLACK indicates the percentage of black to be added to the highlight color. You can use an integer within the range of 0 to 100 for the *bvalue*. The amount of black shading applied depends on the **COVERAGE** percentage, which is applied first. If less than 100 percent is specified, the remaining coverage is achieved with black.

↓ Note

If **BLACK** is not specified, a value of 0 is used as a default.

CMYK *cvalue mvalue yvalue kvalue*

Defines the cyan/magenta/yellow/black color model. *cvalue* specifies the cyan value. *mvalue* specifies the magenta value. *yvalue* specifies the yellow value. *kvalue* specifies the black value. You can use an integer percentage within the range of 0 to 100 for any of the **CMYK** values.

CIELAB *Lvalue (-)c1value (-)c2value*

Defines the **CIELAB** model. Use a range of 0.00 to 100.00 with *Lvalue* to specify the luminance value. Use signed integers from -127 to 127 with *c1value* and *c2value* to specify the chrominance differences.

Lvalue, *c1value*, *c2value* must be specified in this order. There are no defaults for the subvalues.

↓ Note

1. Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **FIELD** or **PRINTLINE** command. The output is device dependent and may not be what you expect.
2. Do not specify two extended color model subcommands on the same **FIELD** or **PRINTLINE** command.

OVERLAY Subcommand

```
OVERLAY {Xname | VARIABLE [START n] LENGTH n}
        [0 0 | rel. x-pos rel. y-pos]
        [OVRotate {0 | 90 | 180 | 270}]
```

Specifies the name of an overlay that is to be positioned relative to the location specified in the **PRINTLINE** command in which the **OVERLAY** subcommand was named. The **PAGEFORMAT OVERLAY** command may contain the named overlays. The maximum number of overlays specified for a **PAGEFORMAT** including the **PRINTLINE OVERLAY** subcommand is 254.

The **OVERLAY** can be identified by specifying a name (*xname*) or by getting the name from the input data record (use **VARIABLE** command).

Xname

The user access name (external name). It can be unquoted or quoted with descriptor tags, indicating the data type (for example, ASCII) of the data in the field.

unquoted-name

An unquoted external name can be up to 6 characters. It is folded to upper case, has an "O1" prefix added to it, and is translated to EBCDIC codepage 500 if necessary.

'quoted-name with no data tag'

A quoted external name can be up to 8 characters. No translation is done. It is the data type (EBCDIC or ASCII) as dictated by the system platform. If not 8 bytes long, it is padded on the right with EBCDIC or ASCII blanks.

C'*quoted-name'*

This quoted external name can be up to 8 characters. No translation is done. It is the data type (EBCDIC or ASCII) as dictated by the system platform. If not 8 bytes long, it is padded on the right with EBCDIC or ASCII blanks.

E'*quoted-name'*

This quoted external name can be up to 8 characters. It is translated, if necessary, to EBCDIC and padded with EBCDIC blanks if it is shorter than 8 bytes.

A'*quoted-name'*

This quoted external name can be up to 8 characters. It is translated, if necessary, to ASCII and padded with ASCII blanks if it isn't 8 bytes long.

X'*hex-digit-pairs'*

This quoted external name can be up to 8 characters (16 hexadecimal digits). No translation is done. If less than 8 characters are coded, the name is padded on the right with blanks of the platform type where the page definition is generated (ASCII on Windows; EBCDIC otherwise). The user can avoid the padding by coding all 16 hexadecimal digits.

VARIABLE

Indicates that the actual name of the overlay, including the O1 prefix, is read from the data record. The **Variable-Name-Locator** field specifies where in the data to get the name.

↓ Note

1. Any overlay that is to be included in this manner must be defined in the **PAGEFORMAT** using the **OVERLAY** command. Any overlay included but not defined will cause a run time print error for a missing MPO structured field, for example APS263I
2. If you specify **VARIABLE** for the **OVERLAY** name and don't want to print the name, then you must have at least one field command, or code **PRINTDATA NO** on the **PRINTLINE** command.

START *n*

The starting position in the data record to get the overlay name. The first data byte position of the input record is 1. If **START** is not coded, 1 is assumed.

LENGTH *n*

Length of field. Specifies the number (n) of bytes to process from the data record, beginning with the position specified in **START**. The maximum length is 8.

OVROTATE {0 | **90** | **180** | **270**}

Specifies the rotation of the placed overlay with respect to the x -axis of the page.

See [FORMDEF Command, p. 235](#) for an **OVROTATE** example, which is presented in the **FORMDEF** description.

SEGMENT Subcommand

```
SEGMENT {Xname | VARIABLE [START n] LENGTH n}
[0 0 rel. x-pos rel. y-pos]
```

Specifies the placement of a segment relative to the location specified in the **PRINTLINE** command in which the **SEGMENT** subcommand was named. The **PAGEFORMAT SEGMENT** command may contain the named segments. The maximum number of segments specified for a **PAGEFORMAT** including the **PRINTLINE SEGMENT** subcommand is 127.

The **SEGMENT** can be identified by specifying a name ($Xname$) or by getting the name from the input data record using **VARIABLE Variable-Name-Locator**.

Xname

Specifies the user-access name as defined in the **SEGMENT** command. It can be unquoted or quoted with descriptor tags within indicate the data type of the data in the field.

unquoted-name

An unquoted external name can be up to 6 characters. It is folded to upper case, have an "O1" prefix added to it, and be translated to EBCDIC codepage 500 if necessary.

'quoted-name with no data tag'

A quoted external name can be up to 8 characters. No translation is done. It is the data type (EBCDIC or ASCII) as dictated by the system platform. If not 8 bytes long, it is padded on the right with EBCDIC or ASCII blanks.

C'*quoted-name'*

A quoted external name can be up to 8 characters. No translation is done. It is the data type (EBCDIC or ASCII) as dictated by the system platform. If not 8 bytes long, it is padded on the right with EBCDIC or ASCII blanks.

E'*quoted-name'*

This quoted external name can be up to 8 characters. It is translated, if necessary, to EBCDIC and padded with EBCDIC blanks if it isn't 8 bytes long.

A'*quoted-name'*

This quoted external name can be up to 8 characters. It is translated, if necessary, to ASCII and padded with ASCII blanks if it isn't 8 bytes long.

X'*hex-digit-pairs'*

This quoted external name can be up to 8 characters (16 hexadecimal characters). No translation is performed. If less than 8 characters are coded, the name is padded on the right with blanks of the platform type where the page definition was generated (ASCII on NT or EBCDIC). You can avoid the padding by coding all 16 hexadecimal digits.

VARIABLE

Indicates that the actual name of the segment, including the S1 prefix, is read from the data record. The **Variable-Name-Locator** field specifies where in the data to get the name.

Note

1. Any page segment that is to be included in this manner should be defined in the **PAGEFORMAT** using the **SEGMENT** command. Defining page segments will enhance print performance.
2. If you specify **VARIABLE** for the **SEGMENT** name and do not want to print the name, then you must have at least one field command, or code **PRINTDATA NO** on the **PRINTLINE** command.

START *n*

The starting position in the data record to get the overlay name. The first data byte position of the input record is 1. If **START** is not coded, 1 is assumed.

LENGTH *n*

Length of field. Specifies the number (*n*) of bytes to process from the data record, beginning with the position specified in **START**. The maximum length is 8.

DIRECTION Subcommand

```
DIRECTION {ACROSS | DOWN | BACK | UP}
```

Specifies the print direction of the line relative to the upper-left corner as you view the logical page. Not all printers can print in all print directions. For more information about your printer, refer to your printer documentation.

If **DIRECTION** is not specified, the direction specified in the **PAGEFORMAT**, p. 399 command is used. Observe that this direction is additive to the direction specified in the **PAGEFORMAT** command.

ACROSS

The printline direction is rotated 0° relative to the direction specified in the **PAGEFORMAT** (the printlines are oriented in the same direction as the page).

DOWN

The printline direction is rotated 90° relative to the direction specified in the **PAGEFORMAT**.

BACK

The printline direction is rotated 180° relative to the direction specified in the **PAGEFORMAT**.

UP

The printline direction is rotated 270° relative to the direction specified in the **PAGEFORMAT**.

OBJECT Subcommand

```
OBJECT {lname [0_0 | re1X re1Y] |  
        VARIABLE [START n] LENGTH n [0_0 | re1X re1Y] OBTYPE Parameters}  
        Other OBJECT Parameters
```

Specifies the placement of a resource object. If an internal name is coded, this is a known object defined by an **OBJECT** command. Otherwise, the object is a variable-named object whose name is

extracted from fields in the line data as described by the **START**, **LENGTH**, **FLDNUM**, or **RECID** parameters. There is no **OBJECT** command for these objects, they must be specified with the **OBTYPE** and **OBID** parameters.

Note

1. All of the **OBJECT** parameters are treated as positional parameters. All positional parameters must be coded in the exact position and order as specified in the syntax diagram.
2. Multiple page/image objects used without specifying a page using **OBPAGE** default to using the first page in the object.

Iname

Specifies the local name of an object that is up to 16 alphanumeric characters in length. The *Iname* is used to match the **PRINTLINE OBJECT** subcommand to its definition from the **OBJECT** command. An object must be defined with this internal name by the **OBJECT** command.

relative-xpos relative-ypos

Specifies the number of units (inches, mm, and so on) that are added to the position of the current printline to position the top-left corner of the object. The values for the horizontal and vertical positioning are limited by the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

Each position specification can be a positive or negative number with up to three decimal places. The units specified can be one of the following: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

VARIABLE

Indicates that the actual name of the object is read from the data record. The **Variable-Name-Locator** field specifies where in the data to get the name.

Note

1. Any object that is to be included in this manner should be defined in the **PAGEDEF** using the **OBJECT** command. Defining objects will enhance print performance.
2. If you specify **VARIABLE** for the **OBJECT** name and do not want to print the name, then you must have at least one field command, or code **PRINTDATA NO** on the **PRINTLINE** command.

START *n*

The starting position in the data record to get the object name. The first data byte position of the input record is 1. If **START** is not coded, 1 is assumed.

LENGTH *n*

Length of field. Specifies the number (*n*) of bytes to process from the data record, beginning with the position specified in **START**. The maximum length is 8.

OBTYPE

```
OBTYPE {PSEG | IOCA | BCOCA | GOCA | PTOCA |
        OTHER OBID {comp-id | type-name}}
```

Used to specify the type of the object. Observe that each of the object types restricts the type of mapping option allowed in the placement of the object (**OBMAP** on the **OBJECT** subcommand on the **PRINTLINE** command.)

PSEG

Specifies a page segment object, as described in the *Mixed Object Document Content Architecture (MODCA) Reference Manual*. All mapping types (**OBMAP**) are allowed by PPFA, however, the print server issues an error if any of the objects contained in the page segment are not compatible with the coded **OBMAP** parameter.

GOCA

Specifies a graphic object, as described in the *Graphics Object Content Architecture (GOCA) Reference Manual*. **GOCA** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBMAP** subcommand.

BCOCA

Specifies a bar code object, as described in the *Bar Code Object Content Architecture (BCOCA) Reference Manual*. **BCOCA** allows you to specify only the **LEFT** parameter on the **OBMAP** subcommand.

IOCA

Specifies an image object, as described in the *Image Object Content Architecture (IOCA) Reference Manual*. **IOCA** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBMAP** subcommand.

PTOCA

Specifies a presentation text object with Object Environment Group (OEG) as described in the *Presentation Text Object Content Architecture (PTOCA) Reference Manual* and the *Mixed Object Document Content Architecture (MODCA) Reference Manual*. The **PTOCA** object type allows you to specify the **LEFT** parameter in the **OBMAP** subcommand.

OTHER

Specifies other object data. The object data to be included is a paginated presentation object with a format that may or may not be defined by an AFP presentation architecture. When you specify **OTHER**, you must also specify the **OBID** parameter. **OTHER** allows you to specify **TRIM**, **FIT**, **CENTER**, **REPEAT**, and **FILL** parameters on the **OBMAP** subcommand.

OBID

Specifies either a component identifier or a type name from [Non-OCA Objects Supported by IOB, p. 419](#). The **OBID** is translated into an Encoded OID and matched to the OID inside the object; they must match.

component-id

Specifies the component identifier from the "Component ID" column of Table [Non-OCA Objects Supported by IOB, p. 419](#).

type-name

Specifies a name from the "Type Name" column of Table [Non-OCA Objects Supported by IOB, p. 419](#).

Non-OCA Objects Supported by IOB

Type Name	Component ID	Description of OBID Object Type
EPS	13	Encapsulated PostScript
TIFF or TIF	14	Tag Image File Format
WINDIB	17	Device Dependent Bit Map [DIB], Windows Version
OS2DIB	18	Device Dependent Bit Map [DIB], PM Version
PCX	19	Paint Brush Picture File Format
GIF	22	Graphics Interchange Format
JFIF, JPEG, or JPG	23	AFPC (AFP Consortium) JPEG Subset
PDFSPO	25	PDF Single Page Object
PCLPO	34	PCL Page Object
EPSTR	48	EPS with Transparency
PDFSPOTR	49	PDF Single Page Object with Transparency
MTIFF	61	TIFF Multiple Image File
MTIFFNT	62	TIFF Multiple Image without Transparency File
MPDF	63	PDF Multiple Page File
MPDFT	64	PDF Multiple Page with Transparency File
PNG	65	PNG File Format
AFPCTIFF	66	AFPC TIFF subset

Object Types that can be referenced as Secondary Resources

Type Name	Component ID	Description of OID Type-Name
PDFRO	26	PDF Resource Object (new)
RESCLRPRO	46	Resident Color Profile Resource Object
IOCAFS45RO	47	IOCA FS45 Resource Object Tile (new)

OBSIZE

```
OBSIZE {USEOBJ | wd [unit] hg [unit]}
```

Specifies the size of the object placement area. When no **OBSIZE** is specified, the default is the size specified in the object. If no size is specified in the object, the size of the page is

used. The page width is as specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

USEOBJ

Specifies that the size measurements specified in the object are to be used. If no size is specified in the object, the size of the page is used, which is the length and width as specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

wd

Specifies the width of an object placement area as a number with up to three decimal places. The allowable width may vary with the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the width parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

↓ Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

hg

Specifies the height of the object placement area as a number with up to three decimal places. The allowable height may vary with the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the height parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

↓ Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

OBJMAP

OBJMAP { **LEFT** | **TRIM** | **FIT** | **CENTER** | **REPEAT** | **FILL** }

Specifies mapping options. The **OBJMAP** parameter defines the mapping of the object to the object placement area. If **OBJMAP** is not coded, the mapping option within the object is used. If the object does not contain a mapping option, then the print server sets it to the created default for the container type.

Each object type (**OBJTYPE** on the **OBJECT** command) specifies the allowable mapping options for that type. When it can, PPFA issues a message when these rules are violated. However, in the case of an object type of page segment (**OBJTYPE=PSEG**), PPFA does not know what types of objects are contained in it; therefore, PPFA cannot enforce the restrictions. See [OBJECT Command, p. 371](#) for a description of the restrictions.

LEFT

Specifies that the object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relative-xpos*, *relative-ypos*, **OBCHPOS**, and **OBCVPOS** parameters. Any portion of the object that falls outside the object placement area as defined by the **OBSIZE** parameter is not trimmed and could cause an exception condition by the presentation system.

TRIM

Specifies position and trim. The object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relative-xpos*, *relative-ypos*, **OBCHPOS**, and **OBCVPOS** parameters. Any portion of the object that falls outside the object placement area as defined by the **OBSIZE** parameter is trimmed.

FIT

Specifies scale to fit; this is the default value if the **OBMAP** parameter is not coded. The object is to be scaled to fit within the object placement area, as defined by the **OBSIZE** parameter. The center of the object is placed in the center of the object placement area and the object is scaled up or down to fit the block. Scaling in the horizontal and vertical directions is symmetrical. The **FIT** parameter ensures that all of the data in the object is presented in the object placement area at the largest possible size. The object is not trimmed.

CENTER

Specifies that the center of the object be positioned at the center of the object placement area. Any portion of the object that falls outside the object placement area is trimmed.

REPEAT

Specifies that the origin of the data object be positioned with the origin of the object placement area. The object is then replicated in the X and Y directions. If the last replicated data does not fit in the object area, it is trimmed to fit.

FILL

Specifies that the center of the data object be positioned coincident with the center of the object placement area. The data object is then scaled, so that it totally fills the object placement area in both the X and Y directions. This may require that the object be asymmetrically scaled by different scale factors in the X and Y directions.

OBCHPOS

```
OBCHPOS {USEOBJ | x-pos}
```

Specifies the horizontal offset of the object contents within the object placement area.

USEOBJ

Specifies that the offset value from the object is to be used. If no value is set in the object, the value defaults to **0**.

x-pos

The valid options for *x-pos* are described in the **SETUNITS** command for the horizontal value.

OBCVPOS

```
OBCVPOS {USEOBJ | y-pos}
```

Specifies the vertical offset of the object contents within the object placement area, as defined by the **OBSIZE** parameter. If **OBCVPOS** is not specified, it defaults to **USEOBJ** and uses the value set in the object. If no value is set in the object, the value defaults to 0. The **OBCHPOS** parameter is used only in **LEFT** and **TRIM** mapping of the object into the object placement area.

USEOBJ

Specifies that the offset value from the object is to be used. If no value is set in the object, the value defaults to **0**.

y-pos

Specifies a positive or negative number. The valid options for *y-pos* are described in the **SETUNITS** command for the vertical value.

OBROTATE

```
OBROTATE {0 | 90 | 180 | 270}
```

Specifies the object rotation with respect to the current LND's coordinate system.

Note

- An included object is positioned and oriented in the following manner:
 - All measurements are from the LND position established by the **PRINTLINE** position. Reference these measurements using the inline direction of the printline.
 - Measure the "relative-xpos and relative-ypos" units from the **PRINTLINE** current position to determine the object area origin.
 - Apply any rotation from **OBROTATE** to modify the **PRINTLINE** axis, and to create the new object area coordinate system.
 - Use the **OBSIZE** parameter to determine the object area size within the object area coordinate system, and to define the object placement area.
 - To determine the object content origin, apply the Object Content Offset from parameters **OBCHPOS** (Object Content Horizontal POSition) and **OBCVPOS** (Object Content Vertical POSition) to the object area origin.
- The object content offset is used only for position (**LEFT**) and position and trim (**TRIM**) mapping options.

OBCOLOR

```
OBCOLOR color-name
```

Specifies the color to be used as the default color or initial color for the object placement area. The **OBCOLOR** parameter is used only for objects of the **PSEG**, **GOCA**, **BCOCA**, **IOCA**, **PTOCA** and **OTHER** type.

colorname

Values for *colorname* can be a defined color (see [DEFINE COLOR Command, p. 279](#)) or one of the **OCA** color spaces listed below.

NONE

DEFAULT

BLACK

BLUE
BROWN
GREEN
RED
PINK (or **MAGENTA**)
TURQ (or **CYAN**)
YELLOW
DARKBLUE (or **DBLUE**)
ORANGE
PURPLE
MUSTARD
GRAY
DARKGREEN (or **DGREEN**)
DARKTURQ (or **DTURQ**)
DARKCYAN (or **DCYAN**)

↓ **Note**

This function requires both the print server and printer support. Check your print server and printer documentation.

OBPAGE

OBPAGE *n*

Specifies the page number of a multipage object or file to be presented. *n* is the page number. A number from 1 to 999999999 (9 digits) is valid.

OBRESOLUTION

OBRESOLUTION *x-res y-res* {**IN** | **CM**}

Specifies the resolution and unit of measurement of an image. If the resolution is already specified inside the image, this information is ignored by the printer. Use this subcommand for images that do not or may not contain their resolution. Specify resolution of an image so that the printer can print the image correctly.

To specify object resolution, you must have a printer and a print server that support this capability.

If not specified, the default is to assume that the image resolution is the same as the printer. If the image does not print at the size you expect, use **OBRESOLUTION** to identify the image's resolution. With the resolution information, the printer will then be able print the image at the expected size.

x-res

Specifies the number to be used for the horizontal resolution of an image. Specify an integer value in the range of 1–3276.

y-res

Specifies the number to be used for the vertical resolution of an image. Specify an integer value in the range of 1–3276.

unit

Specifies a unit of measurement. The choices are:

IN

Inch

CM

Centimeter

Code Example: In the following example, the **OBJECT** subcommand is used to define a JFIF object (which may be specified as JPG). This object has a resolution of 300 pels per inch in both the *x* and *y* directions.

```
Pagedef  obres2  replace  yes;

PRINTLINE  OBJECT  VAR  .4  .5  start  2  length  6
           OBTYPE  OTHER  OBID  JPG
           OBRESOLUTION  300  300  IN;
```

OBCPSS

```
OBCPSS  PSS
```

Specifies the presentation space size to be used for the object. **OBCPSS** may be specified once. If **OBCPSS** is specified but no *PSS* value is entered, an error message will be issued.

PSS

Specifies the presentation space size. Values for *PSS* can be:

mediabox — Specifies MediaBox

cropbox — Specifies CropBox

bleedbox — Specifies BleedBox

trimbox — Specifies TrimBox

artbox — Specifies ArtBox

In Figure [Example of PPFA Support for IOB in a PAGEDEF, p. 424](#), the page definition *pd1* has defined an object with an external name of *PSEGxyz*, of object type **PSEG**. The object has an internal name of *xyzintname*. The internal name identifies the object for the **PRINTLINE OBJECT** subcommand when the object is placed.

Example of PPFA Support for IOB in a PAGEDEF

```
PAGEDEF  pd1  Replace  Yes
COMMENT  'this is my program';

OBJECT  xzZIntName
      OBXNAME  PSEGxyz
      OBTYPE  PSEG ;

PAGEFORMAT  pf1;
PRINTLINE
      OBJECT  xyzintname  -1.1  in  2.1  in
      OBSIZE  3  in  5  in
      OBMAP  FILL
      OBCOLOR  BLUE ;
```

The **PRINTLINE** in **PAGEFORMAT** pf1 places the object on the page 1.1 inches to the left and 2.1 inches below the current printline position. It also maps the object into the object area with the **FILL** parameter, which centers the object in the object area and totally fills the area, possibly with different scaling factors in the X and Y directions. It has an area size of 3 by 5 inches, and overrides the default presentation space color to **BLUE**.

SEGMENT Command

```
SEGMENT name ;
```

Use the **SEGMENT** command only if you want page segments to be loaded to the printer before the page begins printing. If segments are used repeatedly and need to be available in the printer, this eliminates the need to load them each time. However, they do take up raster-pattern storage.

A separate **SEGMENT** command is required for each page segment with a maximum of 127 **SEGMENT** commands within a single page format.

- For Traditional:

```
PAGEFORMAT
TRCREF
SEGMENT
:
SEGMENT
```

- For Record Format and XML:

```
PAGEFORMAT
SEGMENT
:
SEGMENT
```

A **SEGMENT** command is nested within the page format and follows the **PAGEFORMAT** command.

For traditional page formats: To include a page segment on a page without using an IPS structured field within the user data, see the [PRINTLINE Command \(Traditional\)](#), p. 405.

SEGMENT *name*

Specifies the alphanumeric name of 1 to 6 characters (user-access name) of the page segment. Each name must be unique within a single page format.

Note

The prefix "S1" is not part of the six-character user-access name.

SETUNITS Command

```
SETUNITS x-pos {IN | MM | CM | POINTS | PELS | CPI}
y-pos {IN | MM | CM | POINTS | PELS | LPI}
[[LINESP n {IN | MM | CM | POINTS | PELS | LPI}]] ;
```

The **SETUNITS** command specifies the value and the unit of measurement that are the defaults for any subsequent measurement parameter in all of the commands and subcommands. These values remain the

default values until another **SETUNITS** command is specified. The **SETUNITS** command should be specified as the first command in a page definition. If neither this command nor a measurement parameter is specified, the defaults identified within the following description are used.

SETUNITS

Specifies the value and the unit of measurement that are the defaults for any subsequent measurement parameter in all of the commands and subcommands.

x-pos

Specifies the number used for horizontal measurement. A number with up to three decimal places is used. The default is **1**. The choices are **IN**, **MM**, **CM**, **POINTS**, **PELS**, or **LPI**. The default is **IN**.

↓ Note

This value affects subsequent **OFFSET** subcommands.

y-pos

Specifies the number used for vertical measurement. A number with up to three decimal places is used. The default is **1**. The choices are **IN**, **MM**, **CM**, **POINTS**, **PELS**, or **LPI**. The default is **IN**.

↓ Note

This value affects subsequent **OFFSET** subcommands.

Using CPI and LPI Units of Measurement

The **CPI** and **LPI** units of measurement make it possible to write the following command:

```
SETUNITS 10 CPI 6 LPI ;
```

This command sets the units of measurement for horizontal and vertical spacing in terms of characters per inch and lines per inch. You can then use the **OFFSET** subcommand specifications to increment the spacing one character or one line at a time. The distance specified by *n* characters over and by *n* lines down is defined in the governing **SETUNITS** command. In this example, there are 10 characters per inch (**CPI**) and 6 lines per inch (**LPI**).

Subcommand

LINESP Subcommand

```
LINESP n {IN | MM | CM | POINTS | PELS | LPI}
```

Determines the line density or “leading” of the text. Any unit of measurement can be used.

For Traditional: This subcommand value affects:

- The following **PRINTLINE NEXT** subcommand
- The vertical (*y*) position of the first line on a logical page when the **LINEONE** subcommand is not specified and the default is assumed

The default is **6 LPI**. If **LINESP** is allowed to default to **6 LPI**, the **LINEONE** default is 1 L-unit less than 80% of 1/6 inch.

For Record Format and XML: This subcommand value affects the **LAYOUT NEXT** subcommand.

n

Specifies the number of units of measurement between lines.

unit

Specifies a unit of measurement. The choices are:

IN

Inch

LPI

Lines-per-inch

MM

Millimeter

CM

Centimeter

PELS

L-units per inch (The number of L-units per inch can be defined by the user or can default to 240 L-units in an inch)

POINTS

Points per inch (72 points in an inch)

TRCREF Command (Traditional)

```
TRCREF [n] FONT name [DIRECTION {ACROSS | DOWN | BACK | UP}]
[ROTATION {0 | 90 | 180 | 270}] ;
```

The **TRCREF** command specifies the relationship between a font and a table-reference character (TRC) in the data. When specified, the **TRCREF** command must immediately follow a **PAGEFORMAT** command.

```
PAGEFORMAT
  TRCREF
    SEGMENT
    OVERLAY
```

TRCREF

Specifies the TRC numbers that can appear in print data.

n

The allowable values are 0 to 126; each **TRCREF** command must contain a unique number within a page format.

If *n* is omitted, PPFa automatically adds one to the *n* value of the previous **TRCREF** command in the sequence and assigns that value.

The default for the first **TRCREF** command is **0**.

Depending on the value specified for n , the TRC is interpreted by the print server as being either compatible or incompatible with S/370 1403 line-mode. Notice that, if compatibility TRCs are to be used, no fonts should be specified in any **PRINTLINE** or **FIELD** commands within the same **PAGEFORMAT**.

0–3

Indicate a compatible TRC for a S/370 1403 line-mode data stream

4–126

Indicate an incompatible TRC for a S/370 1403 line-mode data stream

Also notice that any TRC number outside the range of 0–3 results in non-compatibility TRCs for the entire page definition. If compatibility TRCs are used, do not specify fonts on **PRINTLINE** or **FIELD** commands within the same **PAGEFORMAT**.

 **Note**

1. You can have multiple TRCs pointing to the same font.
2. If 4 or fewer fonts are specified, they are treated as compatibility TRCs and the leftmost 4 bits of the TRC are ignored. For example, in this case X'F0' and X'00' are both valid for TRC0.

Subcommands

FONT Subcommand

FONT *name*

Specifies the font that is associated with the TRC number.

name

Specifies the local name of a font. The font must be one that has been named in a **FONT** command.

If you have used both the user-access name and the local name in the **FONT** command, use the local name here. If you have used only the user-access name, use it here.

DIRECTION Subcommand

DIRECTION {ACROSS | DOWN | BACK | UP}

Specifies the print direction of the line relative to the upper-left corner as you view the logical page. Not all printers can print in all print directions. For more information about your printer, refer to your printer documentation.

The **DIRECTION** on the **TRCREF** command must match the **DIRECTION** of the **PRINTLINE**, p. 405 command with which the TRC is to be used. If **TRCREF DIRECTION** subcommand is not specified, **DIRECTION ACROSS** is assumed. Observe that this direction is additive to the direction specified in the **PAGEFORMAT** command.

ACROSS

The page is printed with the characters added to the page from *left to right*, and the lines added from the top to the bottom.

DOWN

The page is printed with the characters added to the page from *top to bottom*, and the lines added from the right to the left.

BACK

The page is printed with the characters added to the page from *right to left*, and the lines added from the bottom to the top.

UP

The page is printed with the characters added to the page from *bottom to top*, and the lines added from the left to the right.

ROTATION Subcommand

```
ROTATION {0 | 90 | 180 | 270}
```

Specifies the rotation of characters in degrees. The specified value is relative to the inline direction of the printline.

If the **ROTATION** subcommand is not specified, the default is the rotation value specified on the **FONT** command.

3

XLAYOUT Command (XML)

```
XLAYOUT
[DEFAULT | qtagname | QTAG starttag...]
[BODY [GROUP | NOGROUP]
    [XSPACE {0 | n [IN | MM | CM | POINTS | PELS]]] |

```

The **XLAYOUT** command addresses an XML data item by specifying a **QTAG** (qualified tag) for that data. A **QTAG** is a series of XML start tags that fully identify the XML data item.

Before printing the data, PSF scans the XML data item and matches it to an **XLAYOUT** command in the page definition by using its **QTAG**. The matching **XLAYOUT** command in the page definition is used to position and format the associated XML data item and its attributes on the printed page.

The XML page definition function has the following new PPFA concepts:

Relative Inline Positioning

Relative inline positioning places data relative to the current position. If you position a text field and then place the text, the end of the text becomes the new current position. Graphics, barcodes, objects, segments, and overlays *do not* change the current position after they are originally positioned. For example, if you position a line with a **DRAWGRAPHIC LINE** command, the new current position is the starting point of that line. The length of the graphic line does not change the current position.

There are several restrictions when using relative inline positioning:

1. **XLAYOUT** commands with relative positioning cannot contain any of the following:
 - **FIELD** commands with inline positioning relative to the **XLAYOUT (LPOS)**
 - **FIELD ATTR** (attribute) with inline positioning relative to the **XLAYOUT (LPOS)**
 - **FIELD** commands with barcodes
 - **DRAWGRAPHIC** commands
 - **OBJECT** subcommands
 - **SEGMENT** subcommands
 - **OVERLAY** subcommands
2. You can only use the **SAME** parameter for inline positioning on the **XLAYOUT** command when the previously used **XLAYOUT** command used absolute inline positioning.

Absolute Inline Positioning:

Allows absolute inline positioning on a **FIELD** command for specific placement of elements.

Attributes are Special FIELDS:

The attribute is identified by name and the data printed is from the attribute value or a portion of the attribute value and not from the element content.

↓ Note

1. If a **FIELD** is used for presenting any piece of data on the **XLAYOUT** command, **FIELD** commands must be used for all pieces of data presented on the **XLAYOUT** command. Since an attribute is a special field, if you want to print both an attribute value and the element data you need to code the attribute field for the attribute value and a regular field for the element data.
2. PSF suppresses leading and trailing blanks (X'40' for EBCDIC or X'20' for ASCII) in the data. Multiple embedded blanks are reduced to one blank.
3. The **XLAYOUT** command defines an XML page definition. **XLAYOUT** commands cannot be mixed with **PRINTLINE** commands, which define traditional page definitions, or with **LAYOUT** commands, which define record formatting page definitions.

Subcommands

DEFAULT Subcommand

```
[DEFAULT | qtagname | QTAG starttag...]
```

The **DEFAULT** subcommand specifies a qualified tag that is used to identify the page definition.

DEFAULT

This keyword is used only when the layout type is either **PAGEHEADER** or **PAGETRAILER**, and no name is needed. Only one default **PAGEHEADER** or **PAGETRAILER** can be specified in a **PAGEFORMAT**.

qtagname

The *qtagname* is a defined qualified tag. It is defined by the **DEFINE** *qtagname* **QTAG** command at the beginning of the page definition.

QTAG *starttag*

This is an explicit Qualified Tag. It is defined by coding a series of start tags separated by commas. A start tag is an XML data element name. Put the start tag in quotes if you want to preserve its case. Otherwise it is folded to upper case.

Example of XML Data and Associated Page Definition with Start Tags

```
<person>
  <name>
    <first>Justin</first>
    <last>Case</last>
  </name>
</person>

PAGEDEF xxx...;
  DEFINE lname QTAG 'person','name', 'last';
  :
  Pageformat x ...
    XLAYOUT lname POSITION...
  :
  Pageformat y ...
    XLAYOUT QTAG 'person','name','last' POSITION ...
  :
```

In Figure [Example of XML Data and Associated Page Definition with Start Tags, p. 431](#), `person`, `name`, and `first` are start tags. The qualifying tag for the data item `Case` is `'person', 'name', 'last'`. In the page definition, both **XLAYOUT** commands address the same XML data item, `Case`.

Layout Type Subcommand

```
[BODY [GROUP | NOGROUP]
  [XSPACE {0 | n [IN | MM | CM | POINTS | PELS]]] |
PAGEHEADER [CONTINUE] |
PAGETRAILER [CONTINUE] |
GRPHEADER [CONTINUE] [XSPACE {0 | n [IN | MM | CM | POINTS | PELS]]]
```

Specifies the layout type.

BODY

The **BODY** layout type is used for the majority of data in your database. This is the default.

GROUP

The **GROUP** parameter indicates that the existing group header should be saved and used for subsequent pages.

NOGROUP

The **NOGROUP** parameter indicates that the active group header record should be discarded and not reprinted on subsequent pages. This is the default

XSPACE

XSPACE indicates the amount of extra space from the position of the layout to the bottom of the group header area. This allows the user to identify the amount of extra space in excess of one text line being used by the header so that the baseline moves down and the following group data is not placed on top of the header area. This space is not calculated by PPFA and must be explicitly defined by the user.

PAGEHEADER

This layout type specifies a header that is to be printed on each new page. The baseline position of this layout is normally in the top margin, but can be anywhere on a logical page. If **RELATIVE** is specified, the position is considered to be relative to the page origin. The header usually contains the customer's name, address, account number, and so forth. Only one default **PAGEHEADER** layout can be specified in a **PAGEFORMAT** and no input record data can be specified in a default layout.

CONTINUE

The **CONTINUE** parameter indicates that this **XLAYOUT** command is a continuation of the Page Header definition. The formation of the Page Header may require the data from more than one data element. This is done by specifying the **CONTINUE** parameter.

PAGETRAILER

This layout type specifies a trailer that is to be printed on each new page. The baseline position of this layout is normally in the bottom margin, but can be located anywhere on a logical page and can be specified as **RELATIVE**. Only one default **PAGETRAILER** layout can be specified in a **PAGEFORMAT** and no input record data is processed with a default layout. It may contain the name of the form or a footnote.

CONTINUE

The **CONTINUE** parameter indicates that this **XLAYOUT** command is a continuation of the Page Trailer definition. The formation of the Page Trailer may require the data from more than one data element. This is done by specifying the **CONTINUE** parameter.

GRPHEADER

This layout type specifies a header that is to be printed at the beginning of a group of data. If a logical page eject occurs before the group of data ends, the header is printed after the top margin on each new page until the group ends. The baseline position of this layout can be specified as **RELATIVE**. It may include column headings.

CONTINUE

The **CONTINUE** parameter indicates that this **XLAYOUT** command is a continuation of the Group Header definition. The formation of the Group Header may require the data from more than one data element. This is done by specifying the **CONTINUE** parameter.

XSPACE

XSPACE indicates the amount of extra space from the position of the layout to the bottom of the group header area. This allows the user to identify the amount of extra space in excess of one text line being used by the header so that the baseline moves down and the following group data is not placed on top of the header area. This space is not calculated by PPFA and must be explicitly defined by the user. See Figure [Example of XSPACE, p. 433](#) (shaded space shows group header area):

Example of XSPACE

Checks	Check No.	Date	Amount
	352	01/04/90	\$ 321.50
	353	01/05/90	\$ 100.00
	354	01/10/90	\$ 122.30

XSPACE

Once a Group Header record is processed and is still active when leaving the **PAGEFORMAT**, the group header record is saved by the presentation services program. Whenever the same **PAGEFORMAT** is re-invoked, this saved group header record is presented again if the first body record after re-invoking the **PAGEFORMAT** selects a Body record that has the Group Indicator on.

NEWPAGE Subcommand

NEWPAGE

This parameter indicates that a new page should be started with this layout name. If this is a header or trailer layout, the print position is moved to the start of a new page before this header or trailer becomes the active header or trailer.

DELIMITER Subcommand

DELIMITER [C | X] 'bytes'

The delimiter is a one or two byte code specified in either character or hex indicates a delimiting character within the customer's database and is used to separate fields. PPFA does not translate these characters. Hex characters must be entered in uppercase within the quotation marks.

PRINTDATA Subcommand

PRINTDATA [YES | NO]

Specifies whether the line of data associated with the current **LAYOUT** should be printed. The **PRINTDATA** subcommand is useful when the data stream is interspersed with lines of comments, blank lines, or lines without data that are not meant to be printed.

YES

Specifies that the data for the current **XLAYOUT** is printed. YES is the default.

NO

Specifies that the data for the current **XLAYOUT** is not printed.

DIRECTION Subcommand

```
DIRECTION {ACROSS | DOWN | BACK | UP}
```

Specifies the print direction of the line relative to the upper-left corner as you view the logical page. Not all printers can print in all print directions. For more information about your printer, refer to your printer documentation.

If **DIRECTION** is not specified, the direction specified in the **PAGEFORMAT** command is used. Observe that this direction is additive to the direction specified in the **PAGEFORMAT** command. See [PAGEFORMAT Command](#), p. 399.

ACROSS

The layout direction is rotated 0 degrees relative to the direction specified in the **PAGEFORMAT** (the layouts are oriented in the same direction as the page).

DOWN

The layout direction is rotated 90 degrees relative to the direction specified in the **PAGEFORMAT**.

BACK

The layout direction is rotated 180 degrees relative to the direction specified in the **PAGEFORMAT**.

UP

The layout direction is rotated 270 degrees relative to the direction specified in the **PAGEFORMAT**.

POSITION Subcommand

```
POSITION [ABSOLUTE | RELATIVE]{LEFTMARGIN |
  SAME | [+ | -] horiz [IN | MM | CM | POINTS | PELS]}
  [ABSOLUTE | RELATIVE] {TOPMARGIN |
    NEXT |
  SAME | [+ | -] vert [IN | MM | CM | POINTS | PELS]}
```

Specifies the starting position of the layout in the printout. This is for use in positioning **FIELD**, **DRAWGRAPHIC**, and **ENDGRAPHIC** text and graphics. If Relative is specified or **POSITION** is not specified, the baseline of the Position is relative to the previous **LAYOUT** position.

1. For **PAGEHEADER** RCD: The baseline position can be anywhere on a logical page, but cannot be specified as Relative.
2. For **PAGETRILER**, **GROUPHEADER**, and **BODY** RCDs: The baseline position can be anywhere on a logical page and can be specified as **RELATIVE**.

ABSOLUTE

Specifies that the following horizontal position value is to be processed as an absolute value.

RELATIVE

Specifies that the following horizontal position value is to be processed as a value relative to the current inline position.

horizontal position

LEFTMARGIN

Specifies this line starts at the position specified as the horizontal (*x*) value in the previous **LEFTMARGIN** subcommand within this page definition.

SAME

Specifies this line starts at the same horizontal offset position as the previously coded **XLAYOUT**. If applied to the first **XLAYOUT** of a logical page, the horizontal position is 0, which is the default.

Note

This parameter is not valid with **RELATIVE** *horizontal*.

=

Alternate for **SAME**.

horiz

Specifies the horizontal offset from the left side of the logical page. The value is a number with up to three decimal places. The valid options for *horiz* are described in the **SETUNITS** command for the horizontal value.

ABSOLUTE

Specifies that the following vertical position value is to be processed as an absolute value.

RELATIVE

Specifies that the following vertical position value is to be processed as a relative value. The **XLAYOUT** is positioned relative to the last **XLAYOUT** placed on the page.

Note

1. When using **RELATIVE** positioning, PPFa does not flag off-the-page conditions for the position of a **XLAYOUT** or for any overlays, segments or objects placed relative to that **XLAYOUT**. **XLAYOUT**s that fall outside the bounds of the logical page are flagged by the print server at run time.
2. When specifying **RELATIVE**, use the minus sign to indicate any negative values for the **XLAYOUT** vertical position; you may use the plus sign to indicate positive values. If no sign is used, a positive value is assumed.
3. The **DIRECTION** for a relative **XLAYOUT** must be **ACROSS**. Fields associated with a relative **XLAYOUT** must have the same **DIRECTION** as the **XLAYOUT** and must match the **PAGEFORMAT DIRECTION**.
4. If **RELATIVE** is specified with **SAME** as the *vert* value, the relative value in the **XLAYOUT** is +0.
5. **RELATIVE** positioning is allowed on a **XLAYOUT** command only if the **XLAYOUT** and all its associated **FIELD** commands are formatted to print in the same direction as the **PAGEFORMAT**. That is, the **DIRECTION** parameter in the **XLAYOUT** and any associated **FIELD** commands must specify (or default to) **ACROSS**. The **DIRECTION** in the **PAGEFORMAT** or **PAGEDEF** command may be any allowable value: **ACROSS**, **DOWN**, **BACK**, or **UP**.

vertical position

TOPMARGIN

Specifies that the **XLAYOUT** is placed in the position specified as the vertical (*y*) value in the **TOPMARGIN** subcommand within this page definition.

NEXT

Specifies the layout is to be positioned down (on the logical page) one line from the previous field. The **LINESP** subcommand of the **SETUNITS** command establishes the distance from one line to the next.

When **NEXT** is specified for the first **XLAYOUT** of a logical page, the starting position of the line is one line down from the top of the logical page, as defined by the **TOPMARGIN** subcommand.

Note

The “down” direction is determined by the direction of the logical page (as specified in the page format), not the **XLAYOUT** direction. **NEXT** is, therefore, mainly useful in **ACROSS XLAYOUT** commands.

SAME

Specifies this **XLAYOUT** starts at the same vertical position as the previous **XLAYOUT**.

=

Alternate for **SAME**.

vert

Specifies the vertical offset from the top side of the logical page. The value options for *vert* are described in the **SETUNITS** command for the vertical value.

ENDSPACE Subcommand

```
ENDSPACE n [IN | MM | CM | POINTS | PELS]
```

If the remaining body space is less than the value specified, **ENDSPACE** causes a logical page eject to be executed. This can be used, for example, on a **GRPHEADER** layout to ensure that a group header does not print at the end of a page without the first data record of the group.

ENDSPACE does not include the space within the bottom margin (specified on the **PAGEDEF** or **PAGEFORMAT** command). This indicator is ignored on a **PAGEHEADER** or **PAGETRAILER** layout.

COLOR Subcommand

```
COLOR colorname
```

Specifies an **OCA** or defined color for the text of this field. This subcommand is recognized only by printers that support multiple-color printing. Refer to your printer publication for information about the colors that can be printed.

colorname

Values for *colorname* can be a defined color (see [DEFINE COLOR Command, p. 279](#)), or an **OCA** *colorname*. Values for **OCA** *colornames* are:

NONE
DEFAULT
BLACK
BLUE
BROWN

GREEN
RED
PINK (or **MAGENTA**)
TURQ (or **CYAN**)
YELLOW
DARKBLUE (or **DBLUE**)
ORANGE
PURPLE
MUSTARD
GRAY
DARKGREEN (or **DGREEN**)
DARKTURQ (**DTURQ**, or **DCYAN**, or **DARKCYAN**)

The color choices depend on the printer.

If you do not enter one of these colors, the default color for that printer is used. **NONE** is the color of the medium. **DEFAULT** is the printer default color.

Note

In some printer manuals, the color turquoise (**TURQ**) is called "cyan", and the color pink (**PINK**) is called "magenta".

PPFA supports the following synonyms:

- **CYAN** for **TURQ**
- **DARKCYAN** for **DARKTURQ**
- **DBLUE** for **DARKBLUE**
- **DCYAN** for **DARKTURQ**
- **DGREEN** for **DARKGREEN**
- **DTURQ** for **DARKTURQ**
- **MAGENTA** for **PINK**

Note

Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **XLAYOUT** command. The output is device dependent and may not be what you expect.

Color Model Subcommands

```
[RGB rvalue gvalue bvalue] |
HIGHLIGHT hvalue [COVERAGE cvalue] [BLACK bvalue] |
CMYK cvalue mvalue yvalue kvalue |
CIELAB lvalue [(-)] c1value [(-)] c2value
```

These subcommands specify the color of print for this field supported in MO:DCA for the Red/Green/Blue color model (**RGB**), the highlight color space, the Cyan/Magenta/Yellow/Black color model (**CMYK**), and the **CIELAB** color model.

RGB *rvalue gvalue bvalue*

Three **RGB** integer values are used. The first (*rvalue*) represents a value for red, the second (*gvalue*) represents a value for green, and the third (*bvalue*) represents a value for blue. Each of the three integer values may be specified as a percentage from 0 to 100.

↓ **Note**

An **RGB** specification of 0/0/0 is black. An **RGB** specification of 100/100/100 is white. Any other value is a color somewhere between black and white, depending on the output device.

HIGHLIGHT *hvalue* **COVERAGE** *cvalue* **BLACK** *bvalue*

Indicates the highlight color model. Highlight colors are device dependent.

You can use an integer within the range of 0 to 65535 for the *hvalue*.

↓ **Note**

An *hvalue* of 0 indicates that there is no default value defined; therefore, the default color of the presentation device is used.

COVERAGE indicates the amount of coverage of the highlight color to be used. You can use an integer within the range of 0 to 100 for the *cvalue*. If less than 100 percent is specified, the remaining coverage is achieved with the color of the medium.

↓ **Note**

Fractional values are ignored. If **COVERAGE** is not specified, a value of 100 is used as a default.

BLACK indicates the percentage of black to be added to the highlight color. You can use an integer within the range of 0 to 100 for the *bvalue*. The amount of black shading applied depends on the **COVERAGE** percentage, which is applied first. If less than 100 percent is specified, the remaining coverage is achieved with black.

↓ **Note**

If **BLACK** is not specified, a value of 0 is used as a default.

CMYK *cvalue* *mvalue* *yvalue* *kvalue*

Defines the cyan/magenta/yellow/black color model. *cvalue* specifies the cyan value. *mvalue* specifies the magenta value. *yvalue* specifies the yellow value. *kvalue* specifies the black value. You can use an integer percentage within the range of 0 to 100 for any of the **CMYK** values.

CIELAB *Lvalue* (-)*c1value* (-)*c2value*

Defines the **CIELAB** model. Use a range of 0.00 to 100.00 with *Lvalue* to specify the luminance value. Use signed integers from -127 to 127 with *c1value* and *c2value* to specify the chrominance differences.

Lvalue, *c1value*, *c2value* must be specified in this order. There are no defaults for the subvalues.

↓ **Note**

1. Do not specify both an **OCA** color with the **COLOR** sub-parameter and an extended color model on the same **XLAYOUT** command. The output is device-dependent and may not be what you expect.
2. Do not specify two extended color model subcommands on the same **XLAYOUT** command.

FONT Subcommand

FONT *name1* [, *name2*]

Defines the font to be used for the layout.

name1

Specifies the name of a font used to print the data. This font must have been defined in a previous **FONT**, p. 347 command in this page definition.

If Shift-Out, Shift-In (SOSI) processing is used, *name1* must be the single-byte font.

name2

Specify only when using Shift-Out, Shift-In (SOSI) processing to dynamically switch between a single-byte font and a double-byte font within the layout. *name2* must be the double-byte font.

↓ **Note**

1. If this subcommand is not specified in the print data, the print server uses the font indicated. Otherwise, the print server selects a default font.
2. *name2* is only valid with EBCDIC data.

OBJECT Subcommand

OBJECT *lname* [0 0 | *relX relY*] *Other OBJECT Parameters*

Specifies the local name of an object that is to be positioned and oriented relative to the location specified in the **XLAYOUT** command in which the **OBJECT** subcommand was named. The **OBJECT**, as identified by the *lname* parameter, must have been defined by an **OBJECT** command.

↓ **Note**

Multiple page/image objects used without specifying a page using **OBPAGE** will default to using the first page in the object.

You may place multiple objects on the same **XLAYOUT** command and you may place the same object multiple times. Each placement must have its own set of placement parameters, as follows:

lname

Specifies the local name of an object that is up to 16 alphanumeric characters in length. The *lname* parameter is used to match the **XLAYOUT OBJECT** subcommand to its definition from the **OBJECT** command. An object must be defined with this internal name by the **OBJECT** command.

relX relY

Specifies the number of units (inches, mm, and so on) that are added to the position of the current **XLAYOUT** to position the top-left corner of the object. The values for the horizontal

and vertical positioning are limited by the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

Each position specification can be a positive or negative number with up to three decimal places. The units specified can be one of the following: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

OBSIZE

```
OBSIZE {USEOBJ | wd [unit] hg [unit]}
```

Specifies the size of the object placement area. When no **OBSIZE** is specified, the default is the size specified in the object. If no size is specified in the object, the size of the page is used. The page width is as specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

USEOBJ

Specifies that the size measurements specified in the object are to be used. If no size is specified in the object, the size of the page is used, which is the length and width as specified on the **PAGEDEF** or **PAGEFORMAT** commands, or it defaults to 8.3 inches by 10.8 inches.

wd

Specifies the width of an object placement area as a number with up to three decimal places. The allowable width may vary with the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the width parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

hg

Specifies the height of the object placement area as a number with up to three decimal places. The allowable height may vary with the type of printer used and the L-units specified with the **PELSPERINCH** parameter on the **PAGEDEF** or **PAGEFORMAT** command.

unit

Specifies a unit of measurement for the height parameter. The choices are: **IN**, **MM**, **CM**, **POINTS**, or **PELS**.

Note

If no unit is specified, the default is the most recent **SETUNITS** command value or **IN** (inch) if a **SETUNITS** command has not been issued.

OBMAP

```
OBMAP {LEFT | TRIM | FIT | CENTER | REPEAT | FILL}
```

Specifies mapping options. The **OBMAP** parameter defines the mapping of the object to the object placement area. If **OBMAP** is not coded, the mapping option within the object is used. If the object does not contain a mapping option, then the print server sets it to the created default for the container type.

Each object type (**OBTYPE** on the **OBJECT** command) dictates the allowable mapping options for that type. When it can, PPFA issues a message when these rules are violated. However, in the case of an object type of page segment (**OBTYPE=PSEG**), PPFA does not know what types of objects are contained in it; therefore, PPFA cannot enforce the restrictions. See [OBJECT Command, p. 371](#) for a description of the restrictions.

LEFT

Specifies that the object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relX*, *relY*, **OBCHPOS**, and **OBCVPOS** parameters. Any portion of the object that falls outside the object placement area as defined by the **OBSIZE** parameter is not trimmed and could cause an exception condition by the presentation system.

TRIM

Specifies position and trim. The object is positioned at the upper, left-hand corner of the object placement area, as defined or defaulted by the *relX*, *relY*, **OBCHPOS**, and **OBCVPOS** parameters. Any portion of the object that falls outside the object placement area as defined by the **OBSIZE** parameter is trimmed.

FIT

Specifies scale to fit; this is the default value if the **OBMAP** parameter is not coded. The object is to be scaled to fit within the object placement area, as defined by the **OBSIZE** parameter. The center of the object is placed in the center of the object placement area and the object is scaled up or down to fit the block. Scaling in the horizontal and vertical directions is symmetrical. The **FIT** parameter ensures that all of the data in the object is presented in the object placement area at the largest possible size. The object is not trimmed.

CENTER

Specifies that the center of the object be positioned at the center of the object placement area. Any portion of the object that falls outside the object placement area is trimmed.

REPEAT

Specifies that the origin of the data object be positioned with the origin of the object placement area. The object is then replicated in the X and Y directions. If the last replicated data does not fit in the object area, it is trimmed to fit.

FILL

Specifies that the center of the data object be positioned coincident with the center of the object placement area. The data object is then scaled, so that it totally fills the object placement area in both the X and Y directions. This may require that the object be asymmetrically scaled by different scale factors in the X and Y directions.

OBCHPOS

OBCHPOS { <u>USEOBJ</u> <i>x-pos</i> }
--

Specifies the horizontal offset of the object contents within the object placement area as a number.

USEOBJ

Specifies that the offset value from the object is to be used. If no value is set in the object, the value defaults to **0**.

x-pos

Specifies a positive or negative number. The valid options for *x-pos* are described in the **SETUNITS** command for the horizontal value.

OBCVPOS

OBCVPOS {USEOBJ | *y-pos*}

Specifies the vertical offset of the object contents within the object placement area, as defined by the **OBSIZE** parameter. The **OBCHPOS** parameter is used only in **LEFT** and **TRIM** mapping of the object into the object placement area.

USEOBJ

Specifies that the offset value from the object is to be used. If no value is set in the object, the value defaults to **0**.

y-pos

Specifies a positive or negative number. The valid options for *y-pos* are described in the **SETUNITS** command for the vertical value.

OBROTATE

OBROTATE {0 | 90 | 180 | 270}

Specifies the object rotation with respect to the current LND's coordinate system.

OBCOLOR

OBCOLOR *color-name*

Specifies the color to be used as the default color or initial color for the object placement area. The **OBCOLOR** parameter is used only for objects of the **PSEG**, **GOCA**, **BCOCA**, **IOCA**, **PTOCA** and **OTHER** type.

colorname

Values for *colorname* can be a defined color (see [DEFINE COLOR Command, p. 279](#)) or one of the **OCA** color spaces listed below.

NONE
DEFAULT
BLACK
BLUE
BROWN
GREEN
RED
PINK (or **MAGENTA**)
TURQ (or **CYAN**)

YELLOW
DARKBLUE (or **DBLUE**)
ORANGE
PURPLE
MUSTARD
GRAY
DARKGREEN (or **DGREEN**)
DARKTURQ (**DTURQ**, or **DCYAN**, or **DARKCYAN**)

OBPAGE

OBPAGE *n*

Specifies the page number of a multipage object or file to be presented. *n* is the page number. A number from 1 to 999999999 (9 digits) is valid.

OBCPSS

OBCPSS *PSS*

Specifies the presentation space size to be used for the object. OBCPSS may be specified once. If OBCPSS is specified but no PSS value is entered, an error message will be issued.

PSS

Specifies the presentation space size. Values for **PSS** can be:

mediabox — Specifies MediaBox
cropbox — Specifies CropBox
bleedbox — Specifies BleedBox
trimbox — Specifies TrimBox
artbox — Specifies ArtBox

OVERLAY Subcommand

OVERLAY *Xname* [0 0 | *reIX reIY*] [**OVROTATE** {0 | **90** | **180** | **270**}]

Specifies the name of an overlay that is to be positioned relative to the location specified in the **XLAYOUT** command in which the **OVERLAY** subcommand was named. The **PAGEFORMAT OVERLAY** command may contain the named overlays. The maximum number of overlays specified for a **PAGEFORMAT**, including the **XLAYOUT OVERLAY** subcommand, is 254.

Specifies the electronic overlay that is to be used with this subgroup.

Xname

Specifies the user-access name as defined in the **OVERLAY** command.

↓ Note

1. PPFA checks for duplication of local names. If there is a duplication, the page definition is generated, but a warning message is issued.
2. PPFA does not check for duplicate user-access names.

reIX reIY

Specifies the number of units (inches, mm, and so on) that are added to the position of the layout to position the top-left corner of the overlay. The values for horizontal and vertical may be (+) or (-). The maximum value is + or - 32760 L-units. For example:

```
OVERLAY NAME1 2 in 1 in
OVERLAY NAME2 5 mm 1 mm
```

Note

Any offset coded in the overlay itself is added to this offset.

OVROTATE

Specifies the rotation of the placed overlay with respect to the x-axis of the page.

See [FORMDEF Command, p. 235](#) for an **OVROTATE** example, which is presented in the **FORMDEF** description.

SEGMENT Subcommand

```
SEGMENT Xname [0 0 | relX relY]
```

Specifies the name of a segment that is to be positioned relative to the location specified in the **XLAYOUT** command in which the **SEGMENT** subcommand was named. The **PAGEFORMAT SEGMENT** command can contain the named segments. The maximum number of segments specified for a **PAGEFORMAT** including the **XLAYOUT SEGMENT** subcommand is 127.

Specifies the page segment that is to be used with this subgroup.

Xname

Specifies the user-access name as defined in the **SEGMENT** command.

Note

1. PPFA checks for duplication of local names. If there is a duplication, the page definition is generated, but a warning message is issued.
2. PPFA does not check for duplicate user-access names.

relX relY

Specifies the number of units (inches, mm, and so on) that are added to the position of the layout to position the top-left corner of the page segment. The values for horizontal and vertical may be (+) or (-). The maximum value is + or - 32760 L-units. For example:

```
SEGMENT MYSEG1 2 in 1 in
SEGMENT MYSEG1 5 mm 1 mm
```

Example of Printing XML Data with a Page Definition

Figure [XML Data, p. 444](#) shows the XML data to be printed.

XML Data

```
<customer type='Home'>

PPFA Messages and Codes

System Dependencies for PPFA

PPFA is a cross system product that operates on:

- Windows Operating Systems

For the level of the operating system on which PPFA can run, refer to the *Licensed Program Specification*.

PPFA creates page definitions and form definitions used for AFP printing.. Page definitions and form definitions created on one system can be used for printing on another system. However, not all versions of print servers support all functions provided by PPFA. Use the Programming Guide or User's Guide for your print server system to determine which functions are supported by your system.

While page definitions and form definitions created on one system can be used on any of the systems, the method of creating these resources is different.

Each system is presented to show how PPFA creates page definitions and form definitions. In the examples, the prefixes F1 and P1 are automatically added by PPFA to the user name designated for form definitions and page definitions.

Windows Environment

The **ppfa** command creates form definitions and page definitions on the Windows operating system. After they are created, you can transfer the form definitions and page definitions to other operating systems (such as OS/390, VM, or VSE) to use as AFP resources.

Syntax

```
ppfa [ -fpath.ext ] [ -ppath.ext ] [ -spath.ext ] [ -x ] inputfile
```

Flags and Values

You can specify these flags and values with the **ppfa** command.

inputfile

The file containing the PPFA source statements to be “processed”.

-f*path.ext*

Specify the path and extension for the form definitions generated by PPFA. The names of the form definitions are derived from the *name* parameter of each **FORMDEF** command in the input file, with F1 prefixed. The default path is the current directory and the default extension is no extension.

↓ **Note**

If you specify a path without an initial dot or delimiter, the results can be ambiguous. For example, if you enter:

```
ppfa -fabc\def.xyz input.file
```

the form definition might be stored in either `abc\def` or `.\abc\def`.

-p*path.ext*

Specify the path and extension for the page definitions generated by PPFA. The names of the form definitions are derived from the *name* parameter of each **PAGEDEF** command in the input file, with P1 prefixed. The default path is the current directory and the default extension is no extension.

↓ **Note**

If you specify a path without an initial dot or delimiter, the results can be ambiguous. For example, if you enter:

```
ppfa -pabc\def.xyz input.file
```

the page definition might be stored in either `abc\def` or `.\abc\def`.

-s*path.ext*

Specify the path and extension information for the listing file generated by PPFA. The name of the listing file is the same as the name of the input file. The default path is the current directory and the default extension is no extension.

↓ **Note**

If you specify a path without an initial dot or delimiter, the results can be ambiguous. For example, if you enter:

```
ppfa -sabc\def.xyz input.file
```

the listing file might be stored in either `abc\def` or `.\abc\def`.

-x

Causes PPFA to interpret information found in columns 1–72 of the input file. The information in the rest of the columns is ignored. This is useful if you are downloading a Fixed-80 file from the host.

Examples

You have an input file called `myinput.txt` in the current directory. `myinput.txt` contains these PPFA source statements:

```
⋮
FORMDEF myformdef
⋮
PAGEDEF mypagedef
```

:

1. To create a form definition and page definition from `myinput.txt` and store them in the in the current directory, enter this command:

```
ppfa -f..f1 -p.p1 myinput.txt
```

The generated form definition is called `F1myformdef.f1`. The generated page definition is called `P1mypagedef.p1`.

2. To create a form definition and page definition from `myinput.txt`, and then store them in the `C:\resources` directory, enter this command:

```
ppfa -fC:\resources.f1 -pC:\resources.p1 myinput.txt
```

3. To create a listing file called `myinput.list` and store it in the `C:\listings` directory, enter this command:

```
ppfa -sC:\listings.list myinput.txt
```

3

More about Direction

In PPFA, directions specified with the **PRINTLINE** and **TRCREf** commands are relative to the direction specified in the **PAGEFORMAT** command. If no **PAGEFORMAT** command has been specified, the direction specified in the **PAGEDEF** command is used. If no direction has been specified in either of these commands, the default direction for the page format is **ACROSS**.

The **PRINTLINE** and **TRCREf** commands *add* their **DIRECTION** values to the **DIRECTION** value specified with the **PAGEFORMAT** command. Thus, you may select a **PAGEFORMAT** direction and code **PRINTLINEs** and **TRCREfs** relative to the **PAGEFORMAT** direction. For more information about the **PRINTLINE** and **TRCREf** commands, see [Using Page Definition Commands for Traditional Line Data, p. 39](#).

For instance, if a page is to be printed in the landscape page presentation on a printer that requires the **DOWN** or **UP** print direction to generate landscape output, the **PAGEFORMAT** command can specify **DOWN** as its **DIRECTION**. Once this direction is established, you can view the page as a landscape page and specify the **PRINTLINE** and the **TRCREf** commands with the **ACROSS** direction. Output specified in this way prints **ACROSS** relative to the landscape page, as shown in Figure [Printing Across a Landscape Page, p. 449](#).

Printing Across a Landscape Page

Note

If you specify the **DOWN** direction for the **PRINTLINE** or the **TRCREf** command in this case, the output looks like Figure [Printing Down a Portrait Page, p. 450](#) because the direction of the page format is also **DOWN**.

Printing Down a Portrait Page

The next table shows the final result when all of the possible combinations of **DIRECTION** are specified. The final direction that PPFA computes from the **PAGEFORMAT**, **PRINTLINE**, and **TRCREf** commands determines the prefix assigned to the font names specified in the page definition. The final direction is particularly important when printing on the 3800 printer because its unbounded-box font architecture requires a separate font for each combination of print direction and character rotation. This information is encoded in the prefix of the font name (X1, X3, XA, and XF, for example).

The Effect of Additive DIRECTIONS on Formatting and Font Prefixes

Page Format	PRINTLINE or TRCREf	Final Result	3800 Font Prefix			
			0°	90°	180°	270°
Across	Across	Across	X1	X5	X9	XD
Across	Down	Down	X2	X6	XA	XE
Across	Back	Back	X3	X7	XB	XF
Across	Up	Up	X4	X8	XC	XG
Down	Across	Down	X2	X6	XA	XE
Down	Down	Back	X3	X7	XB	XF
Down	Back	Up	X4	X8	XC	XG
Down	Up	Across	X1	X5	X9	XD
Back	Across	Back	X3	X7	XB	XF
Back	Down	Up	X4	X8	XC	XG
Back	Back	Across	X1	X5	X9	XD
Back	Up	Down	X2	X6	XA	XE
Up	Across	Up	X4	X8	XC	XG
Up	Down	Across	X1	X5	X9	XD
Up	Back	Down	X2	X6	XA	XE
Up	Up	Back	X3	X7	XB	XF

The entries in the **Final Result** column can be computed using a simple algorithm. If you assume that **ACROSS** is 0, **DOWN** is 1, **BACK** is 2, and **UP** is 3, you can add the direction specifications in the two commands, subtracting 4 when the result is 4 or greater, to compute the final direction.

Differences in Measurements and REPEATs with AFP Utilities

When repeating a **DRAWRULE** (OGL), **PRINTLINE** (PPFA), **DRAWGRAPHIC** (PPFA), or "Line" (PMF), there are differences in the measurements of the repeated lines. For OGL, **REPEAT** indicates the number of repetitions *in addition to* the first. For **DRAWGRAPHIC** (PPFA), **REPEAT** is the same as OGL. Therefore, **REPEAT** yields 2 **DRAWRULE**s. For PPFA, **REPEAT** indicates the total number of **PRINTLINE**s. Therefore, **REPEAT** yields 2 **PRINTLINE**s.

Another difference occurs when the line spacing (set by **SETUNITS** in OGL and PPFA, and by a screen item in PMF) results in the distance from one line to the next not being a whole number of pels. Each product handles the fractional pel differently. Because the printer cannot print parts of a pel, fractional pels cannot be represented at the printer. When line spacing calculations result in a fractional pel per line space, the following occurs:

OGL

Carries the fractions until they add up to a whole pel, then adds it in. This results in the final spot of a repeat being within a pel of where it is expected. Therefore, not all of the spaces between rules are even; they can vary by one pel.

PPFA

Truncates the fractional pel prior to the repeat. Therefore, the spaces between the lines are even, but the total might be shorter than expected.

PMF

Rounds the fractional pel prior to the repeat. Therefore, the spaces between the lines are even, but the total might be shorter or longer than expected. If the fractional pel is less than 0.5, it is handled the same as PPFA and the line space is shorter. If the fractional pel is greater than or equal to 0.5, the line space is longer.

Use line spacing in all products that result in a whole number of pels. To resolve existing problems, select the resource that you don't want to change, and code the remaining resource without using **REPEAT** because of the way the other products handle the fractional pels.

For example, if you want to print at 9 lines per inch, and repeat this for 20 lines, the following occurs. Starting at zero, and adding 9 lines per inch (converted to pels this is $240/9 = 26.6670$), you see the results illustrated in the next table.

Differences in Measurements and REPEATs with AFP Utilities

Repetition	Mathematics		OGL		PPFA		PMF	
	Position	From-Last	Position	From-Last	Position	From-Last	Position	From-Last
	0.000	-.-	0	-	0	-	0	-
1	26.667	26.667	26	26	26	26	27	27
2	53.333	26.667	53	27	52	26	54	27
3	80.000	26.667	80	27	78	26	81	27
4	106.667	26.667	106	26	104	26	108	27
5	133.333	26.667	133	27	130	26	135	27
6	160.000	26.667	160	27	156	26	162	27

Repetition	Mathematics		OGL		PPFA		PMF	
	Position	From-Last	Position	From-Last	Position	From-Last	Position	From-Last
7	186.667	26.667	186	26	182	26	189	27
8	213.333	26.667	213	27	208	26	216	27
9	240.000	26.667	240	27	234	26	243	27
10	266.667	26.667	266	26	260	26	270	27
11	293.333	26.667	293	27	286	26	297	27
12	320.000	26.667	320	27	312	26	324	27
13	346.667	26.667	346	26	338	26	351	27
14	373.333	26.667	373	27	364	26	378	27
15	400.000	26.667	400	27	390	26	405	27
16	426.667	26.667	426	26	416	26	432	27
17	453.333	26.667	453	27	442	26	459	27
18	480.000	26.667	480	27	468	26	486	27
19	506.667	26.667	506	26	494	26	513	27
20	533.333	26.667	533	27	520	26	540	27

To resolve differences in how OGL, PPFA, and PMF handle repeated values, one of the following approaches may be taken:

- Do not use **REPEAT**
- Code units as **PEL(s)**

Note that in all of these products (except PPFA), a **PEL** is 1/240 of an inch. For PPFA, the **PEL** size can be set by the user, but defaults to 1/240 of an inch.

More About Bar Code Parameters

This section contains supplemental information about Bar Code Object Content Architecture (BCOCA) specified by the **BARCODE** subcommand of the **FIELD** command, and includes the following topics:

- [Bar Code Concatenation, p. 452](#)
- [Notes about Bar Codes, p. 454](#)

For more complete information, refer to *Data Stream and Object Architectures: Bar Code Object Content Architecture Reference*, S544-3766.

Bar Code Concatenation

The concatenated bar code function allows the user to collect bar code data from different fields and/or records to be concatenated in generating a bar code object.

For example, the hyphen in a nine-digit ZIP code, *aaaaa-bbbb*, is not a valid character in a **POSTNET** bar code. The concatenated bar code function will allow a user to specify a **FIELD** for the *aaaaa* and a

FIELD for the *bbbb* and concatenate them together into one bar code. In the case of **2D** bar codes, which can contain many bytes of data, multiple records of data can be concatenated together into one bar code.

The defining bar code fully defines a bar code, specifying any necessary placement or descriptive parameters. A defining bar code can start the collection of bar code data if it specifies a **BARCODE** name and the **BCDSYMB** keyword with a symbol name.

The continuation bar code defines bar code data that is to be added to a bar code data collection started with a defining bar code with **BCDSYMB** coded. This bar code uses the defining **BARCODE** name and **BCDSYMB** name but does not have the **TYPE** or **BARCODE** parameters specified because it uses the information from the defining bar code.

Bar Code Concatenation Example 1 : POSTNET 9-Digit Bar Code Split into 2 Fields

```
PAGEDEF BC1P REPLACE YES;
FONT afont GT10;
PAGEFORMAT example1;
PRINTLINE POSITION 4 in 1.5 in;
  FIELD START 1 LENGTH 15 POSITION 0 IN 0 IN;
  FIELD START 16 LENGTH 20 POSITION 0 IN NEXT;
  FIELD START 36 LENGTH 15 POSITION 0 IN NEXT;

  FIELD START 51 LENGTH 5 POSITION 0 IN 0.70 IN
    BARCODE zip54 TYPE POSTNET MOD 1 BCDSYMB datacoll;
  FIELD START 57 LENGTH 4 BARCODE zip54 BCDSYMB datacoll;
```

Bar Code Concatenation Example 2 : 2D Bar Code with Data Bytes across Multiple Records

```
PAGEDEF BC2P REPLACE YES;
FONT afont GT10;
PAGEFORMAT example2;
PRINTLINE POSITION 1 in 1 in;
  FIELD START 1 LENGTH 200
    POSITION 1.0 IN 1.0 IN DIRECTION ACROSS
    BARCODE maxi1 TYPE 2DMATRIX MOD 0 BCXPARMS ESC E2A
    BCDSYMB bcd2 BCDSEQ 5;

PRINTLINE REPEAT 4;
  FIELD START 1 LENGTH 200 DIRECTION ACROSS
    BARCODE maxi1 BCDSYMB bcd2 BCDSEQ 1;
```

Notes about Bar Codes

Note

1. A barcode cannot be positioned on or outside of the logical page.
For example, the page definition below results in a position of 0 0 which is on the logical page boundary. **The following example results in a printer error:**

```
PAGEDEF XMPL1 REPLACE YES;
SETUNITS 1 IN 1 IN LINESP 6 LPI;
  FONT FNT1 CR10;
  FONT FNT2 CR10;
PAGEFORMAT IBMSSN WIDTH 9.5 HEIGHT 4.0      /* PORTRAIT */
DIRECTION ACROSS;
PRINTLINE
  FONT FNT1 REPEAT 1 CHANNEL 1 POSITION 0 0;
  FIELD START 671 LENGTH 13 POSITION 0 0
  BARCODE 30F9
  TYPE 1 MODWIDTH 17
  SSASTERISK ON;
```

2. If you want to suppress blanks, use the **SUPPBLANKS** parameter.
3. **SUPPBLANKS** for bar code data will cause the entire field to be ignored if it is all blanks.
4. The height of the barcode symbol is controlled by the barcode symbology definition and by various BCOCA parameters. The width of the symbol is usually dependent on the amount of data to be encoded and by choices made in various BCOCA parameters.

Linear Symbologies

The element-height and height-multiplier parameters specify the height of the symbol. For some barcode types, these parameters also include the height of the human-readable interpretation (HRI). Refer to the description of the element-height parameter in the *Data Stream and Object Architectures: Bar Code Object Content Architecture Reference, S544-3766* for a description of the height for specific linear symbols. Some barcode symbologies (Australia Post Bar Code, Japan Postal Bar Code, POSTNET, RM4SCC, and REDTAG) explicitly specify the barcode symbol height; in this case, the element-height and height-multiplier parameters are ignored.

Two-Dimensional Matrix Symbologies

The MaxiCode symbology specifies a fixed physical size, nominally 28.14 mm wide by 26.91 mm high; the module-width, element-height, and height-multiplier parameters are ignored for MaxiCode values.

Data Matrix symbols are rectangular and are made up of a pattern of light and dark squares (called modules). The size of each module is specified in the module-width parameter and the number of rows and columns of these modules is controlled by the desired-number-of-rows and desired-row-size parameters and the amount of data to be encoded. The element-height and height-multiplier parameters are ignored for Data Matrix symbols.

QR Code symbols are square and are made up of a pattern of light and dark squares (called modules). The size of each module is specified in the module-width parameter; the number of rows and columns of these modules is controlled by the version parameter, the error correction level selected, and the amount of data to be encoded. The element-height and height-multiplier parameters are ignored for QR Code symbols.

Two-Dimensional Stacked Symbologies

PDF417 symbols are rectangular and are made up of a pattern of light and dark rectangles (called modules). The size of each module is specified in the module-width, element-height, and height-multiplier parameters and the number of rows and columns of these modules is controlled by the data-symbols and rows parameters and the amount of data to be encoded. A PDF417 symbol must contain at least three rows.

Set Media Origin (SMO)

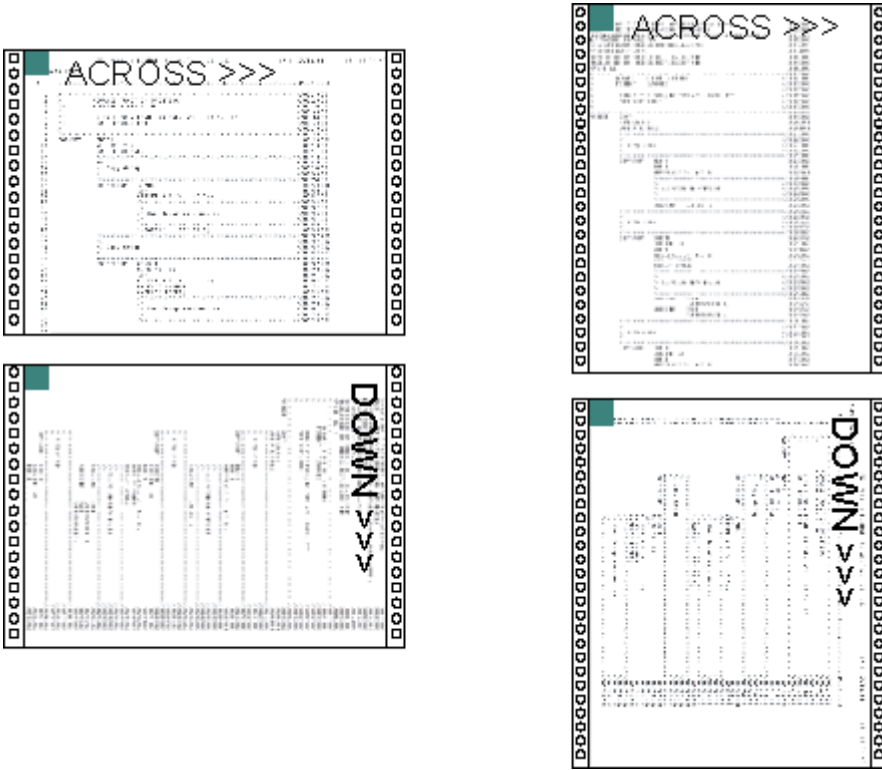

This section explains how to generate the correct Set Media Origin (SMO) information in a form definition.

Background

IBM 3800-3

The first AFP printer was the IBM 3800-3 delivered in 1983. It had a single, fixed media origin or “top, left-hand corner” as shown by the shaded rectangle in Figure [Fixed Media Origins for the IBM 3800-3 Printer, p. 456](#). Print data could be placed to print across, down, or up the page. Across and down are shown. Page definitions, (pagedefs), were used to place the line data on the page. IBM provided page definitions for common line spacings for both portrait and landscape orientation. The two most common paper sizes used were 12" x 8.5" (shown on left) and 9.5" x 11" (shown on right). As shown below different page definitions are required to print the same output on the two different sizes of paper. For example an “across” page definition is used to print landscape output on 12" x 8.5" paper and a “down” page definition is used for landscape output on 9.5" x 11" paper. Forms, like 12" x 8.5", that have a width greater than their length are referred to as “wide continuous forms” and forms, like 9.5" x 11", that have a length greater than their width are called “narrow continuous forms”.

Fixed Media Origins for the IBM 3800-3 Printer

3

IBM 3820

In 1985 the IBM 3820 was introduced. It was the first IBM AFP cut-sheet printer. Like the 3800-3, it had a single, fixed media origin as shown. The 3820 could print in the same directions as the 3800-3 plus one new direction, "back". As shown below it had similar print direction characteristics to a 3800-3 using 9.5" x 11" paper.

Fixed Media Origins for the IBM® 3820 Printer

The Problem

Many customers had both 3800-3s and 3820s. The 3800-3 was the fastest printer of its time at 215 impressions per minute. In order to achieve that speed it had to use the 12" x 8.5" paper. This paper had the additional benefit of reducing maintenance charges because the 3800s usage charge was based on the number of linear feet printed. The use of the shorter, 12" x 8.5" paper cost less per page than the longer, 9.5" x 11" paper. Unfortunately, when the 12" x 8.5" paper is used on the 3800-3 it

causes an incompatibility with the 3820. As shown in the figure below the 3800-3 with 12" x 8.5" paper has a different media orientation than the 3820.

Differences in Media Origin Between the IBM 3800-3 and IBM 3820 Printers

The 3800-3's media origin is at the left end of the long edge and the 3820's is at the left end of the short edge. Because of this different page definitions would be needed to print the same output on both printers. For example, in order to print landscape output an "across" page definition would be used on the 3800-3 and a "down" page definition for the 3820. This would require different page definitions to be specified for each printer.

Another Problem

AFP also provides the ability to print image data. The print direction coded in the page definition controls how the text data is oriented on the page. Unfortunately it has no effect on data contained within an image. In the figure below an image containing the word, "LOGO" has been placed on the 3800-3 and 3820 pages. It is oriented as desired on the 3820 but appears to be rotated 90 degrees counterclockwise on the 3800-3. In reality the image has not been rotated, the paper has. In order to compensate for this a special, rotated version of the image had to be built for use on the 3800-3 and care taken to use the proper version on both printers.

Rotated Text and Image Data

When IBM was developing its second, continuous forms AFP printer, the 3835, it was decided to develop a solution for the problem of different media origins between cut-sheet and continuous forms printers. The AFP architecture was enhanced to allow the media origin to be moved to any of the four corners of the paper. This function is called Set Media Origin and is controlled by a value in the form definition or formdef. This value is called the Medium Origin and is set using the Page Printer Formatting Aid (PPFA), **PRESENT** and **DIRECTION** parameters on the **FORMDEF** and **COPYGROUP** commands.

FORMDEF PRESENT and DIRECTION Parameters

The use of **PRESENT** and **DIRECTION** parameters on the **FORMDEF** is confusing. The examples in [The SMO Reference Pages, p. 458](#) show a sheet of paper and the placement of the Medium Origin for a particular **PRESENT** and **DIRECTION** combination. Notice that for a particular Medium Origin combination, the results for cut-sheet paper, wide continuous forms paper, narrow continuous forms paper, and Cut Sheet Emulation are different. This was done to guarantee that the application pages would be oriented in the same manner on all printer and media types. Cut Sheet Emulation, (CSE), divides a continuous forms printer's paper web into two equal sheetlets.

The **PRESENT** parameter has two possible values, **PORTRAIT** and **LANDSCAPE**. The **DIRECTION** has values of **ACROSS** and **DOWN**. There is an additional optional parameter, **CUTSHEET**. It specifies whether the SMO command will be sent to cut-sheet printers. This is invoked by coding a value of **YES**. If **NO** is coded or allowed to default the media origin on cut-sheet printers will not be changed and will be at the default location which is equivalent to a form definition with **PRESENT PORTRAIT** and **DIRECTION ACROSS**. Coding the **N_UP** parameter, (1-up, 2-up, 3-up, 4-up), has the same effect as coding **CUTSHEET**. The **CUTSHEET** parameter was created to allow form definitions that did not have **N-UP** coded to cause SMO to be enabled on cut-sheet printers.

Note

Some older printers do not support the SMO function.

When Print Services Facility (PSF) or Infoprint Manager (IPM) converts an output file to Intelligent Printer Data Stream (IPDS) to send to the printer it includes an SMO value if SMO is supported by the printer. This value is calculated by examining the Medium Origin of the form definition and then checking to see if the printer is cut-sheet, wide continuous, or narrow continuous. CSE on the printer will report back wide or narrow continuous as appropriate. PSF/IPM then specifies the proper SMO. The resulting SMO values are included in the figures for completeness.

The SMO Reference Pages

The following pages show how the four possible SMO combinations behave on the following four different printer types:

- Cut-sheet
- Continuous forms with wide paper
- Continuous forms with narrow paper
- Continuous forms with Cut Sheet Emulation enabled

There are four summary pages that show the media origin and print directions for the above printer types. These are followed by detail pages. The top of each detail page shows the:

- Printer type
- Values for Presentation and Direction coded on the form definition used
- Medium Origin value that this combination produces

The page shows six images of a single paper sheet. The media origin or "top, left-hand corner" is shown with a shaded rectangle. The top three sheets show how data is oriented for:

- Simplex sheet or front of a duplex sheet
- Back of a normal duplex sheet

- Back of a tumble duplex sheet

Simulated hole punches and rotation axis lines are provided to help visualize how the back of a duplex sheet relates to the front. An image made from a photograph is included on these sheets to help understand the orientation. The top, left-hand corner of the image is in the same corner as the media origin.

The leftmost sheet on the bottom row shows the four print directions and how they relate to the media origin. The middle sheet shows sample line data formatted using a page definition coded with an "across" print direction. The rightmost sheet shows data formatted with a page definition coded with a "down" print direction. The page definition name, its direction, total lines, and lines-per-inch spacing are given below each page.

Cut-Sheet Emulation

Cut-Sheet Emulation for Continuous Forms Printer Wide and Narrow Paper Set Media Origin

PPFA Keywords

A keyword is a word in PPFA that must be entered exactly as shown. Keywords cannot be used as second names for commands (like **FONT** and **OVERLAY**) which can have 2 positional parameters as names. This is less restrictive than prior versions of PPFA.

Note

When keywords are longer than five characters, they may be abbreviated to the first five characters. The shorthand form of the keyword must also be avoided as a name. For example, since **PAGEH** and **CONDI** are 5 character forms for **PAGEHEADER** and **CONDITION**, they cannot be used as second names.

The following is a list of PPFA reserved keywords:

ABSOLUTE

PPFA Media Names

Table [Registered Media Types Sorted By Media Name, p. 476](#) lists the PPFA media names, media types, and component identifiers.

↓ Note

The range of component ids from 12,288 to 268,435,455 is reserved for user defined media types.

Registered Media Types Sorted By Media Name

Media Name	Media Type	Component ID
BSNS ENV	North American business envelope	143
COM 10 ENV	Com10 envelope (9.5 x 4.125 in)	75
C5 ENV	C5 envelope (229 x 110 mm)	79
DL ENV	DL envelope (220 x 110 mm)	77
EXEC	North American executive (7.25 x 10.5 in)	65
INDEX CD	Index Card	150
ISO A3	ISO A3 white (297 x 420 mm)	10
ISO A3 CO	ISO A3 colored	11

Media Name	Media Type	Component ID
ISO A4	ISO A4 white (210 x 297 mm)	0
ISO A4 CO	ISO A4 colored	1
ISO A4 TAB	ISO A4 tab (225 x 297 mm)	7
ISO A4 THD	ISO 1/3 A4	5
ISO A4 TR	ISO A4 transparent	2
ISO A5	ISO A5 white (148.5 x 210 mm)	20
ISO A5 CO	ISO A5 colored	21
ISO A6 PC	ISO A6 Postcard	152
ISO B4	ISO B4 white (257 x 364 mm)	30
ISO B4 CO	ISO B4 colored	31
ISO B4 ENV	ISO B4 envelope	83
ISO B5	ISO B5 white (176 x 250 mm)	40
ISO B5 CO	ISO B5 colored	41
ISO B5 ENV	ISO B5 envelope	73
ISO C4 ENV	ISO C4 envelope	93
ISO C5 ENV	ISO C5 envelope	103
ISO LNG ENV	ISO long envelope	113
JIS B4	JIS B4 (257 x 364 mm)	42
JIS B5	JIS B5 (182 x 257 mm)	43
JP PC	Japan postcard (Hagaki) (100 x 148 mm)	81
JP PC ENV	Japan postcard envelope (200 x 150 mm)	80
LEDGER	North American ledger (11 x 17 in)	67
LEGAL	North American legal white (8.5 x 14 in)	60
LEGAL CO	North American legal colored	61
LEGAL TAB	Legal tab (9 x 14 in)	146
LEGAL 13	North American legal 13 (Folio) (8.5 x 14 in)	63
LETTER	North American letter white (8.5 x 11 in)	50
LETTER CO	North American letter colored	51
LETTER TAB	Letter tab (9 x 11 in)	145
LETTER TR	North American letter transparent	52
MON ENV	Monarch envelope (7.5 x 3.875 in)	76

Media Name	Media Type	Component ID
RA3	Oversize A3 (16.923 x 12.007 in)	153
RA4	Oversize A4 (8.465 x 12.007 in)	162
STATEMNT	North American statement (5.5 x 8.5 in)	69
US PC	US Postcard	151
9x12 ENV	North American 9 x 12 envelope	133
10x13 ENV	North American 10 x 13 envelope	123
9x12 MAN	Manual (9 x 12 in)	147
8x10 MED	Media (8 x 10 in)	160
8x10.5 MED	Media (8 x 10.5 in)	148
8.5x10 MED	Media (8.5 x 10 in)	157
9x14 MED	Media (9 x 14 in)	149
12x18 MED	Media (12 x 18 in)	155
14x17 MED	Media (14 x 17 in)	154
14x18 MED	Media (14 x 18 in)	156

Fill Patterns for DRAWGRAPHIC Commands

Fill Patterns for DRAWGRAPHIC Commands

PPFA Messages and Codes

At the end of processing for each command, the maximum error level encountered during processing is printed on the system printer, providing the error was not caused by the system printer itself. The meaning of the return codes is shown in Table [Return Codes](#), p. 479.

Return Codes

Return Code	Severity	Description
Return Code 0	I = Information; the command is processed.	PPFA did not encounter any problems. No warning, error, severe-error, or termination-error message was issued.
Return Code 4	W = Warning; the command is processed.	PPFA encountered at least one non-terminating error, solved by an assumption. At least one warning message was issued. No error, severe-error, or terminating-error message was issued. The requested function was probably correctly performed. The program executed to completion.

Return Code	Severity	Description
Return Code 8	E = Error; the command is partially processed.	PPFA encountered at least one error, but no severe or terminating error. A requested function may be partially incomplete.
Return Code 12	S = Severe error; the command is not processed.	PPFA encountered a severe error. The program executed to completion, but some of the functions requested were not performed.
Return Code 16	T = Termination error; the job is terminated.	PPFA encountered a terminating error. The program terminated prematurely.

PPFA Messages and Their Meanings

All messages consist of a standard seven-character prefix, followed by the message text. For example:

AKQnnnS THIS IS THE MESSAGE TEXT . . .

nnn is the message number.

S is the message-severity indicator. The indicators are defined in Table [Return Codes, p. 479](#).

Note

1. You cannot use the **psfmsg** command to view PPFA messages.
2. PPFA issues a maximum of 269 user errors generated within a source file. One additional message is used for the message queue to indicate an out-of-storage condition.

Explanation of the PPFA messages

This section lists the explanations of the PPFA messages.

AKQ001E: END OF COMMENT (*/) IS NOT SPECIFIED.

Explanation: The end mark of a comment (*/) is not specified.

System action: The page definition or form definition is not generated. The syntax check may be ended.

Operator response: Specify the end mark of a comment.

AKQ002E: DBCS STRING DOES NOT END WITH SHIFT-IN.

Explanation: DBCS strings in comments must terminate with shift-in.

System action: The form definition or page definition is not generated. The syntax check continues, assuming shift-in.

Operator response: Specify a valid DBCS string enclosed by SO and SI.

AKQ003E: LITERAL DOES NOT END WITH APOSTROPHE.

Explanation: A literal must end with an apostrophe.

System action: The page definition is not generated. The syntax check continues, assuming an apostrophe.

Operator response: Specify a valid literal enclosed by apostrophes. Note that an apostrophe in a literal is specified by consecutive double apostrophes.

AKQ004E: DBCS LITERAL DOES NOT END WITH SHIFT-IN AND APOSTROPHE.

Explanation: A DBCS literal must end with shift-in and apostrophe.

System action: The page definition is not generated. The syntax check continues, assuming the end of the DBCS literal at the end of a record.

Operator response: Specify a valid literal ended by shift-in and apostrophe.

AKQ101E: COMMAND SEQUENCE IS INVALID.

Explanation: The command sequence is invalid.

System action: A page definition or form definition is not generated. The syntax check continues from a valid command.

Operator response: Specify commands in a valid sequence.

AKQ102E: INVALID COMMAND (*erroneous entry*) IS SPECIFIED.

Explanation: An invalid command is specified in the input data.

System action: A page definition or form definition is not generated. The syntax check continues from a valid command.

Operator response: Specify a valid command.

AKQ103E: INVALID SUBCOMMAND (*value*) IS SPECIFIED.

Explanation: An invalid subcommand was specified in the input data. This message is often issued when a semicolon (;) is missing.

System action: A page definition or form definition is not generated. The syntax check continues from the next keyword.

Operator response: Specify a valid subcommand.

AKQ104E: (*command or parameter name*) NAME IS NOT SPECIFIED.

Explanation: The required name is not specified.

System action: A page definition or form definition is not generated. The syntax check continues, assuming blanks or default as the name.

Operator response: Specify the required name.

AKQ105E: REQUIRED PARAMETER IN (*subcommand name*) IS NOT SPECIFIED.

Explanation: The subcommand indicated in the message requires a correct PPFA format.

System action: A page definition or form definition is not generated. The syntax check continues, assuming the default values.

Operator response: Refer to the command reference section of this publication for help in specifying a valid subcommand parameter.

AKQ106E: *command or parameter name*) NAME IS SPECIFIED WITH INVALID SYNTAX.

Explanation: The required name is specified with invalid syntax. See [Character Length for PPFA Names, p. 205](#) for the correct length of names.

System action: A page definition or form definition is not generated. The syntax check continues.

Operator response: Specify a valid name.

AKQ107E: PARAMETER IN (*subcommand name*) IS INVALID.

Explanation: The parameter in the subcommand is invalid (invalid format or out of range).

System action: A page definition or form definition is not generated. The syntax check continues, assuming the default values as the parameter.

Operator response: Specify a valid parameter value.

AKQ108E: (*subcommand name*) SUBCOMMAND IS DUPLICATED IN ONE COMMAND.

Explanation: The subcommand indicated in the message was specified more than once in the same command. Only one such subcommand is permitted within this command.

System action: A page definition or form definition is not generated. The syntax check continues, ignoring the duplicate subcommand.

Operator response: Delete one subcommand.

AKQ109E: (*subcommand name*) SUBCOMMAND CONFLICTS WITH (*subcommand name*) SUBCOMMAND.

Explanation: One subcommand conflicts with another (FONT, PRINTLINE, FIELD, OPCOUNT, OPPOS).

System action: A page definition or form definition is not generated. The syntax check continues, ignoring the latter subcommand.

User response: Delete one of the subcommands.

AKQ110E: THE VALUE OF THE (*command name*) SUBCOMMAND IS TOO LARGE OR TOO SMALL.

Explanation: The parameter in the subcommand is out of range.

IN

136.5

MM

3467.1

CM

346.7

POINTS

9828.0

PELS (L-units)

32760

These values are specified in:

```
FORMDEF N_UP OVERLAY relative_xpos relative_ypos
PAGEDEF PRINTLINE OVERLAY / SEGMENT relative_xpos relative_ypos
```

 **Note**

The values specified for the CPI and LPI are set in the SETUNITS subcommand.

System action: No form definition or page definition is generated. PPFA continues syntax checking.

Operator response: Specify a valid parameter value.

AKQ111E: SUBCOMMAND SEQUENCE IS INVALID: (*subcommand name*) OCCURS AFTER (*subcommand name*)

Explanation: For example, a WHEN subcommand occurs after an OTHERWISE subcommand in a CONDITION command.

System action: A page definition or form definition is not generated. The syntax check continues, ignoring the subcommand.

Operator response: Reorder or rewrite the conditions..

AKQ112E: CONDITION COMMAND DOES NOT ALLOW '*' IN ITS START SUBCOMMAND.

Explanation: A relative position ('*', '* + n', or '* - n') was specified in a START subcommand of a CONDITION command.

System action: A page definition or form definition is not generated. The syntax check continues from the valid subcommand.

Operator response: Specify an absolute starting position.

AKQ113E: MORE THAN ONE 'WHEN' SUBCOMMAND SPECIFIED THE CHANGE PARAMETER.

Explanation: More than one WHEN subcommand specified CHANGE for its field comparison.

System action: A page definition or form definition is not generated. The syntax check continues from the valid subcommand.

Operator response: Remove the extra parameters.

AKQ114E: NUMBER OF PARAMETERS EXCEED LIMIT FOR (*subcommand name*) SUBCOMMAND OR KEYWORD.

Explanation: The named subcommand/keyword in the messages limits the number of parameters that may be coded with a single subcommand or keyword. The number of parameters that can be coded with the named subcommand or keyword is defined in the command reference sections of this publication; see [Form Definition Command Reference, p. 208](#) and [Page Definition Command Reference, p. 269](#).

System action: The form definition is not generated. The syntax check continues from the valid subcommand.

Operator response: Remove the extra parameters.

AKQ115E: REQUIRED PARAMETER(S) (PARM1, PARM2, ...) IN (COMMAND OR SUBCOMMAND) IS (ARE) NOT SPECIFIED.

Explanation: This is a generic message which indicates one or more missing parameters on a subcommand or command. For example a DRAWGRAPHIC BOX must have a BOXSIZE subcommand coded.

System action: A page or form definition is not generated.

Operator response: Provide the correct parameter(s) on the command or subcommand.

AKQ116E: PARAMETER (PARM1) IN (COMMAND OR SUBCOMMAND) IS INVALID.

Explanation: This is a generic message which indicates that a parameter in a subcommand or command is invalid.

System action: A page or form definition is not generated.

Operator response: Provide the correct parameter on the command or subcommand.

AKQ117E: PARAMETER (PARM1) IN (COMMAND OR SUBCOMMAND) IS DUPLICATED.

Explanation: This is a generic message which indicates that a parameter in a subcommand or command is coded more than once. For example, ...LINEWT LIGHT BOLD... shows two different line weights in the same subcommand.

System action: A page or form definition is not generated.

Operator response: Remove one of the parameters.

AKQ118E: MUTUALLY EXCLUSIVE PARAMETERS ON THE (INSERT1) COMMAND OR SUBCOMMAND ARE DUPLICATED.

Explanation: A command or subcommand contains more than one mutually exclusive parameter. For example, the PAGECOUNT subcommand on the PAGEDEF command cannot have both STOP and CONTINUE coded.

System action: A page or form definition is not generated.

Operator response: Remove one of the parameters.

AKQ119E: GRAPHICS-TYPE (BOX, LINE, CIRCLE, ELLIPSE) MUST IMMEDIATELY FOLLOW DRAWGRAPHIC.

Explanation: The DRAWGRAPHIC command must have the graphics type (BOX, LINE, CIRCLE, ELLIPSE) immediately following the command.

System action: A page or form definition is not generated.

Operator response: Code one of the graphics types.

AKQ120I: UNKNOWN COMPONENT ID. PPFA WILL ASSUME IT IS SUPPORTED.

Explanation: PPFA allows the use of numeric component IDs when the object type is OTHER so that new OTHER object types can be supported without a new release of PPFA. This is one of them.

System action: A PAGEDEF will be generated.

Operator response: Insure that the object type component id is supported by your printer and PSF service level.

AKQ121W: COMMAND SEQUENCE IS INVALID. A (*insert-1*) OCCURS BEFORE A (*insert-2*).

Explanation: For example, an overlay occurs outside a copygroup.

System action: A dummy copygroup will be created. This will be the first copygroup. The FORMDEF will be generated.

Operator response: Reorder the command statements.

AKQ122W: THE (*insert-1*) IS TOO LONG. IT IS TRUNCATED TO (*insert-2*) BYTES.

Explanation: The input length of a parameter is exceeded. For example, the maximum length of a barcode Macro is 4096 bytes.

System action: Only the first (*insert-2*) bytes of a parameter will be used. Processing continues. A PAGEDEF will be generated.

Operator response: Use a shorter text parameter.

AKQ201E: (*subcommand name*) SUBCOMMAND IS NOT SPECIFIED.

Explanation: The required subcommand is not specified.

System action: A page definition or form definition is not generated. The syntax check continues, assuming the default.

Operator response: Specify the required subcommand.

AKQ202E: SPECIFIED (*command name*) NAME IS NOT DEFINED.

Explanation: A resource name (OVERLAY, SUPPRESSION, FONT, OBJECT, QTAG, or COLOR) is not defined.

System action: A page definition or form definition is not generated. The syntax check continues.

Operator response: Correct the name.

AKQ203W: (*command name*) NAME IS DUPLICATED.

Explanation: The required name must be unique for OVERLAY, COPYGROUP, FONT, PAGEFORMAT, OBJECT, or SUPPRESSION.

System action: A page definition or form definition is generated.

Operator response: Specify a unique name.

AKQ204E: (*object*) NAME IS DUPLICATED.

Explanation: The name must be unique (OVERLAY, COPYGROUP, FONT, PAGEFORMAT, SEGMENT).

System action: A page definition or form definition is not generated. The syntax check continues.

Operator response: Specify a unique name.

AKQ205E: PAGEFORMAT (*pageformat name*) WAS NOT FOUND IN THIS PAGE DEFINITION.

Explanation: A WHEN or OTHERWISE subcommand of CONDITION specifies a PAGEFORMAT name not found in the page definition being processed.).

System action: A page definition or form definition is not generated. The syntax check continues.

Operator response: Specify a pageformat name that is in the page definition.

AKQ206E: CONDITION (*condition name*) HAS ALREADY BEEN DEFINED.

Explanation: A CONDITION command specifies LENGTH, WHEN, or OTHERWISE, and the condition with this condition name has already been defined by an earlier CONDITION command.

System action: A page definition is not generated. The syntax check continues.

Operator response: Define the condition only the first time it occurs.

AKQ210E: THE RELATIVE POSITION VALUE EXCEEDS THE ALLOWED RANGE.

Explanation: The value specified for the `relative x position` or `relative y position` on the `N_UP` subcommand (for an OVERLAY) or `PRINTLINE` command (for an OVERLAY or SEGMENT) exceeds the range of +32760 to -32760 L-units. For example, assuming the default of 240 pels per inch is being used, the values must be equal to, or less than the following:

IN

136.5

MM

3467.1

CM

346.7

POINTS

9828.0

PELS (L-units)

32760 (+ or -)

CPI

*

LPI

*

The value specified for CPI or LPI in the SETUNITS command will determine whether the value will exceed 32760 L-units.

System action: The page definition or form definition is not generated. The syntax check continues.

Operator response: Correct the relative x and y position values within the allowed range.

AKQ211E: FRONT/BACK SIDE IS NOT SPECIFIED FOR DUPLEX.

Explanation: The SUBGROUP specified with BACK does not exist after the SUBGROUP specified with FRONT, or the SUBGROUP specified with FRONT does not exist before the SUBGROUP specified with BACK.

System action: A form definition is not generated. The syntax check continues.

Operator response: Specify subgroups for both sides.

AKQ212W: PAPER SIDE IS SPECIFIED FOR SIMPLEX.

Explanation: A subgroup specified with BOTH, FRONT, or BACK is invalid with single-sided printing.

System action: A form definition is generated, ignoring the subcommand specifying the paper side.

User response: Either delete the subcommand that specified the paper side or specify DUPLEX.

AKQ213E: LOGICAL PAGE POSITION EXCEEDS THE LIMIT.

Explanation: The logical page position specified by the OFFSET subcommand in the FORMDEF or COPYGROUP command exceeds the limits.

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ214E: MORE THAN 127 SUPPRESSIONS ARE SPECIFIED IN ONE FORMDEF.

Explanation: More than 127 suppressions are specified in one FORMDEF.

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ215E: MORE THAN 127 OVERLAYS ARE SPECIFIED IN ONE COPYGROUP.

Explanation: More than 127 OVERLAYS are specified in one copy group. PPFA can issue this message for an N_UP subcommand that specifies more than 127 overlays.

System action: No form definition is generated. The syntax check continues.

User response Correct the error.

AKQ216E: MORE THAN ONE RASTER OVERLAY IS SPECIFIED IN ONE COPYGROUP.

Explanation: More than one raster OVERLAY is specified in one copy group.

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ217W: LOGICAL PAGE POSITION FOR BACK SIDE OF PAGE SPECIFIED IN SIMPLEX PROCESSING.

Explanation: The logical-page position specified by the OFFSET subcommand in a FORMDEF or COPYGROUP command for the back side of a page was specified, but simplex was specified in a COPYGROUP command.

System action: A form definition is generated, with the back side logical page position included, as if duplex had been specified. The syntax check continues.

Operator response: Correct the error by specifying duplex in the COPYGROUP command or remove the second set of coordinates in the OFFSET subcommand.

AKQ218E: MORE THAN 255 COPIES ARE SPECIFIED IN ONE COPYGROUP.

Explanation: More than 255 copies are specified in a COPYGROUP.

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ219E: MORE THAN 127 SUBGROUPS ARE SPECIFIED IN ONE COPYGROUP.

Explanation: More than 127 subgroups are specified in a COPYGROUP

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ220E: MORE THAN 8 OVERLAYS ARE SPECIFIED IN ONE SUBGROUP.

Explanation: More than eight overlays are specified in one SUBGROUP.

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ221E: MORE THAN 8 SUPPRESSIONS ARE SPECIFIED IN ONE SUBGROUP.

Explanation: More than eight suppressions are specified in one SUBGROUP.

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ222W: DIFFERENT NUMBERS OF COPIES ARE SPECIFIED FOR EACH SIDE OF DUPLEX.

Explanation: The number of copies for BACK side is not equal to those for FRONT side.

System action: A form definition is generated assuming the number of copies specified for front side.

Operator response: Check the number of copies.

AKQ223E: LOGICAL PAGE POSITION FOR (*page side*) SIDE OF PAGE EXCEEDS THE LIMIT.

Explanation: The logical-page position specified by the OFFSET subcommand in a FORMDEF or COPYGROUP command exceeds the limit for the current side of the page.

System action: A form definition is not generated. The syntax check continues.

Operator response: Correct the positioning OFFSET parameter.

AKQ224E: MORE THAN 254 OVERLAYS ARE SPECIFIED IN A PAGEFORMAT.

Explanation: The maximum number of OVERLAY commands is 254. PPFA can issue this message for the OVERLAY subcommand of the PRINTLINE command.

System action: A page definition is not generated. The syntax check continues.

User response: Specify a valid number of OVERLAY commands.

AKQ225E: CONSTANT SUBCOMMAND PARAMETER (*parameter*) SPECIFIED IN SIMPLEX PROCESSING.

Explanation: The BACK or BOTH parameter has been specified for the CONSTANT subcommand within simplex processing.

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct this CONSTANT subcommand or indicate DUPLEX.

AKQ226E: DIRECTION SUBCOMMAND ONLY ALLOWED WITH PRESENT SUBCOMMAND.

Explanation: The DIRECTION subcommand has been specified, but the PRESENT subcommand has not.

System action: A form definition is not generated. The syntax check continues.

Operator response: Either add the PRESENT subcommand or remove the DIRECTION subcommand.

AKQ227E: THE ORIGIN OF THE RESOURCE (*name*) NAMED IN THE PRINTLINE COMMAND IS OFF THE LOGICAL PAGE.

Explanation: The relative position of the PRINTLINE overlay or segment named is off the logical page. The origin of the overlay or segment specified for the resource named in the N_UP subcommand is off the medium.

System action: The page definition that has the overlay or segment in question is not generated. PPFA continues the syntax check, ignoring the problem.

Operator response: Correct the X-position and Y-position for the OVERLAY or SEGMENT subcommand.

AKQ228E: THE ORIGIN OF THE OVERLAY (*overlay name*) NAMED IN THE (*command*) COMMAND IS OFF THE MEDIUM.

Explanation: The resource position values will position the resource such that at least part of the resource will be off the medium (physical page).

System action: The form definition that has the overlay in question is not generated. PPFA continues the syntax check, ignoring the problem.

Operator response: Correct the relative X-position and relative Y-position values for the OVERLAY named in the N_UP subcommand.

AKQ229W: SUBGROUPS FOR FRONT AND BACK OF SAME SHEET USED DIFFERENT BINS.

Explanation: In your subgroup command you specified FRONT and BACK parameters. However, your COPYGROUP has different bins specified.

System action: A form definition is generated that specifies the bin used for the front side.

Operator response: Check the number of copies and correct the bin setting.

AKQ231E: PRINTLINE OR LAYOUT IS NOT SPECIFIED.

Explanation: There is no PRINTLINE or LAYOUT command in the page format.

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify either a PRINTLINE or LAYOUT command.

AKQ232E: REQUIRED SUBCOMMAND TEXT OR LENGTH IS NOT SPECIFIED.

Explanation: A FIELD subcommand must have a TEXT or LENGTH subcommand.

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify either a TEXT subcommand or a LENGTH subcommand.

AKQ233E: THE LOGICAL PAGE SIZE IS TOO LARGE OR TOO SMALL.

Explanation: The specified page size is too large or too small. The page size must be from 1 to 32767 pels. The HEIGHT and WIDTH subcommands must have values between 1 and 32767 PELS, inclusive, or the same measurements expressed in other units.

System action: A page definition is not generated. The syntax check continues, assuming the defaults.

Operator response: Correct the error.

AKQ234E: POSITION OF LINEONE EXCEEDS THE LOGICAL PAGE BOUNDARY.

Explanation: The TOP or MARGIN position specified by the LINEONE subcommand exceeds the logical page boundary. This error message is issued only if TOP or MARGIN is specified.

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify a valid position value.

AKQ235E: MORE THAN 127 SEGMENTS ARE SPECIFIED IN ONE PAGEFORMAT.

Explanation: More than 127 segments are specified in a single PAGEFORMAT command. PPFA can issue this message for the SEGMENT subcommand of the PRINTLINE command.

System action: No page definition is generated. The syntax check continues.

User response: Correct the error.

AKQ238E: MORE THAN 127 FONTS ARE SPECIFIED IN ONE PAGEFORMAT.

Explanation: More than 127 fonts are specified in one PAGEFORMAT or the specified TRC number exceeds 126. PPFA counts each use of a font in more than one direction or rotation as a separate font.

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ239E: PRINT POSITION EXCEEDS THE LOGICAL PAGE BOUNDARY.

Explanation: The print position specified by POSITION subcommand exceeds the logical page boundary.

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ240E: NUMBER OF PRINTLINES, FIELDS, AND CONDITIONS EXCEEDS 65,535 IN ONE PAGE FORMAT.

Explanation: The total number of PRINTLINES, FIELDS, and CONDITIONS exceeds 65,535 in one page format.

System action: A page definition is not generated. The syntax check continues.

Operator response: Reduce the number of PRINTLINES, FIELDS, or CONDITIONS in the page format.

AKQ241E: TOTAL LENGTH OF TEXT DATA EXCEEDS 65,534 BYTES.

Explanation: The total length of text may be up to 65,534 bytes.

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ242E: THE VALUE OF THE STARTING POSITION OF A RECORD IS TOO LARGE OR TOO SMALL.

Explanation: The START position of a record exceeds the maximum (65,535) or minimum (1) value.

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ243E: DBCS LENGTH IS NOT A MULTIPLE OF 2.

Explanation: The number of bytes of DBCS must be a multiple of two. This means that the value of the LENGTH parameter must be a multiple of two.

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify a valid length or a valid DBCS.

AKQ244E: INVALID CODE IS SPECIFIED IN THE TEXT.

Explanation: SBCS text must be within code range X'00' to X'FE'.

Valid double-byte character set (DBCS) codes are between X'41' and X'FE' for each byte. PPFA checks this range. Code X'4040' (blank) is the only exception. For example, the following are valid DBCS codes: X'4040', X'4141', X'41FE', X'FE41', X'FEFE'.

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify a valid code.

AKQ245E: HEXADECIMAL TEXT IS INVALID.

Explanation: Hexadecimal text is specified in an invalid format. Hexadecimal text must have an even length parameter and be in hexadecimal notation ('0' to 'F').

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify valid hexadecimal text.

AKQ246E: NULL LITERAL IS SPECIFIED.

Explanation: The literal has no string.

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify a valid literal.

AKQ247E: KANJI NUMBER TEXT IS INVALID.

Explanation: A Kanji number is specified in invalid format. Kanji number text must be a string of Kanji numbers delimited by commas. Each Kanji number must be a decimal number equal to a valid DBCS code, minus X'4000'.

System action: A page definition is not generated. The syntax check continues.

Operator response: Specify valid kanji number(s) in a valid format.

AKQ248E: TEXT ATTRIBUTE CONFLICTS WITH FONT.

Explanation: SBCS font is specified for DBCS text (type G, K), or DBCS font is specified for SBCS text (type C).

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ249E: TEXT ATTRIBUTE CONFLICTS WITH TEXT TYPE.

Explanation: The literal type conflicts with text type. SBCS literal is specified as type G or X, and DBCS literal is specified as type C, X, or K.

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ250E: TRC NUMBER IS DUPLICATED.

Explanation: The specified TRC number is duplicated in one page format.

System action: A page definition is not generated. The syntax check continues.

Operator response: Correct the error.

AKQ251W: SPECIFIED LENGTH IS SHORTER THAN THE TEXT AND WAS TRUNCATED.

Explanation: The LENGTH parameter of the TEXT subcommand is shorter than the length of the specified literal, which is truncated to a specified length.

System action: The operation continues, truncating the literal.

Operator response: Check the truncation.

AKQ252E: TEXT IS NOT THE LENGTH SPECIFIED BY THE LENGTH SUBCOMMAND.

Explanation: TEXT IS NOT THE LENGTH SPECIFIED BY THE LENGTH SUBCOMMAND.

System action: A page definition is not generated. The syntax check continues.

Operator response: Change the comparison text or the LENGTH parameter so that they match.

AKQ253E: TEXT IN THE 'WHEN' SUBCOMMAND IS TOO LONG.

Explanation: Constant text in a WHEN subcommand of a CONDITION command is too long to fit into an 8150-byte CCP structured field.

System action: A page definition or form definition is not generated. The syntax check continues.

Operator response: Shorten the field to 8000 bytes or fewer, and shorten the comparison text accordingly.

AKQ254E: (text type) LITERAL WAS EXPECTED BUT (text type) WAS FOUND.

Explanation: An SBCS literal occurs where a DBCS one was expected, or vice versa.

System action: A page definition or form definition is not generated. The syntax check continues.

Operator response: In a FIELD command, do not use a DBCS literal without specifying a DBCS font. In a CONDITION command, do not mix SBCS and DBCS literals in the comparison text of a single WHEN subcommand.

AKQ255E: INVOKE SPECIFIES A SIDE FOR WHICH NO PLACE SUBCOMMANDS PUT DATA.

Explanation: The N_UP PLACE subcommand contains an error that makes it incompatible with the value specified in the INVOKE subcommand. Either INVOKE BACK was specified, but PLACE n BACK was not specified, or INVOKE FRONT was specified, but PLACE n FRONT was not specified.

System action: No form definition is generated. Processing continues.

User response: Specify the same value (FRONT or BACK) for both the INVOKE and PLACE subcommands.

AKQ256E: INCORRECT NUMBER OF PLACE SUBCOMMANDS.

Explanation: The required number of PLACE subcommands must be specified.

System action: No form definition is generated. Processing continues.

User response: When using N_UP PLACE subcommands with single-sided printing, the number of PLACE subcommands must equal the value specified on N_UP. When using duplex printing, the number of PLACE subcommands must equal two times the value specified on N_UP.

AKQ257W: CONSTANT (*parameter*) FOUND WITH PLACE SUBCOMMAND.

Explanation: The CONSTANT (*parameter*) subcommand can not be specified when N_UP PLACE subcommands are specified.

System action: A form definition is generated without constant forms control. The syntax check continues.

User response: Delete the CONSTANT (*parameter*) from the FORMDEF or COPYGROUP command.

AKQ258W: MORE THAN 122 OPERATION POSITIONS SPECIFIED FOR A FINISH OPERATION.

Explanation: More than 122 operation finishing positions are specified.

System action: A form definition will be generated with 122 finishing positions. All others will be ignored.

User response: Move extraneous operator position values.

AKQ259W: OPCOUNT AND OPPOS VALUES SPECIFIED. OPCOUNT IGNORED.

Explanation: Both OPCOUNT and OPPOS are specified.

System action: A form definition is not generated.

Operator response: If OPCOUNT is specified, OPPOS is ignored. When using OPPOS for controlling the position of each operation on the operation axis, OPCOUNT is ignored.

AKQ260E: (*insert-1*) not allowed with/on a (*insert-2*).

Explanation: This is a generic message which indicates a contextually incorrect combination of PPFA commands or subcommands. If this message indicates an action is not allowed with/on a CMR of this type, the processing mode is not valid for that type of CMR. LINK is valid only for device link (DL) CMRs and device link (DL) CMRs can only have processing mode LINK. Any other use of LINK processing

mode results in error message AKQ260E. This message may indicate a PPFA command that is not compatible with MO:DCA IS/3.

System action: A page definition or form definition is not generated.

Operator response: Correct the incorrect parameter and rerun the job.

AKQ261E: (*insert-1*) requires (*insert-2*).

Explanation: This is a generic message which indicates a missing PPFA command or subcommand.

System action: A page definition is not generated.

Operator response: Add the required parameter and rerun the job.

AKQ262E: (*insert-1*) specifies a (*insert-2*) which is not a (*insert-3*).

Explanation: This is a generic message which indicates a contextually incorrect combination of PPFA commands or subcommands. For example that an ENDGRAPHIC command has specified or defaulted to a GRAPHID that does not match a floating DRAWGRAPHIC BOX or DRAWGRAPHIC LINE.

System action: A page definition is not generated.

Operator response: Correct the indicated problem.

AKQ263E: (*insert-1*) exceeds (*insert-2*).

Explanation: This is a generic message which indicates an out of bound condition for some parameters. For example that a DRAWGRAPHIC CIRCLE is positioned off the logical page.

System action: A page definition is not generated.

Operator response: Correct the indicated problem.

AKQ264W: (*insert-1*) is ignored (*insert-2*).

Explanation: This is a generic message which indicates that a contextually incorrect combination of PPFA commands or subcommands is clearly incorrect and is just ignored. For example, if a LINEONE subcommand was coded on a Record Format PAGEDEF (for example, one using LAYOUT), the LINEONE subcommand would just be ignored.

System action: A page definition is generated.

Operator response: No action necessary unless the result is not what you wanted.

AKQ265W: (*insert-1*) exceeds (*insert-2*).

Explanation: This is a generic message which indicates an out of bound condition for some parameters which is not necessarily critical. For example, when a DRAWGRAPHIC CIRCLE is positioned outside the margin boundary but still on the logical page.

System action: A page definition is generated.

Operator response: No action necessary unless the result is not what you wanted.

AKQ266E: PAGEDEF CONTAINS BOTH LAYOUT AND PRINTLINE COMMANDS.

Explanation: Lines are placed in a record format page definition using LAYOUT commands or in an XML page definition using XLAYOUT command, otherwise lines are placed with PRINTLINE commands. They cannot be mixed in the same page definition.

System action: A page definition is not generated.

Operator response: Remove either the LAYOUT, XLAYOUT, or PRINTLINE commands.

AKQ267E: MORE THAN ONE DEFAULT PAGEHEADER OR PAGETRAILER IN A PAGEFORMAT.

Explanation: Only one LAYOUT DEFAULT PAGEHEADER or PAGETRAILER can be coded in a PAGEFORMAT.

System action: A page definition is not generated.

Operator response: Remove one of the duplicates.

AKQ268E: SPECIFIED MARGINS FOR THIS PAGEFORMAT OVERLAP.

Explanation: Either the left margin is defined on or right of the right margin or the top margin is defined on or below the bottom margin.

System action: A page definition is not generated.

Operator response: Redefine the margins so that they do not overlap.

AKQ269E: A RECORD FORMAT PAGEDEF REQUIRES AT LEAST ONE FONT DEFINITION.

Explanation: At least one font must be defined whether or not one is referenced.

System action: A page definition is not generated.

Operator response: Define a font.

AKQ270E: PDF417 MACRO DATA BYTE (*insert-1*), CODEPOINT (*insert-2*) CANNOT BE TRANSLATED TO GLI 0 ENCODATION.

Explanation: This is an ASCII barcode and all code points must ultimately end up as ASCII. The printer will translate EBCDIC code points if you tell it, but it will translate the Macro data as well as the regular data.

When EBCDIC TO ASCII translation is requested for a PDF417 barcode, and the PAGEDEF is being compiled on an ASCII platform, and there is macro data it will be in ASCII. You now have mixed data which cannot be translated. So PPFA must translate the ASCII macro data to EBCDIC so that both will be the same. The printer can now translate the data and print the barcode. Now, not all EBCDIC code points will translate to GLIO and we have just found one.

System action: The PAGEDEF will not be generated.

Operator response: Make sure that all the PDF417 macro text will translate to good EBCDIC code points.

AKQ271E: THE FONT TYPE AND USER DATA TYPE (UDTYPE) SPECIFIED CAUSES A DATA TRANSFORMATION THAT IS NOT SUPPORTED.

Explanation: When the User's Data Type (UDType) and font encoding are different, the printer must translate your data to the encoding type of the font. For example, if the UDType is UTF8 and the font is an ASCII font, then the printer would have to translate your data from UTF8 to ASCII. For this reason combinations are restricted to the following:

UDType of UTF8

Fonts can only be ASCII or UNICODE.

UDType of UTF16

Fonts can only be UNICODE.

System action: PAGEDEF is not generated.

User response: Chooses an appropriately encoded font.

AKQ275I: (*insert-1*)

Explanation: This is a generic informational message. Variable text inserts are printed. Two examples are:

1. EXTERNAL OBJECT NAME IS DUPLICATED.
2. KEYWORD USED AS A NAME. CHECK NAME NOT OMITTED. PROCESSING CONTINUES.

System action: Compilation continues. This definition is generated and stored or replaced.

Operator response: Make sure that the situation warned against is desired. For example, that the keyword used as a name is not actually a missing name, or that the duplicated object name is intended.

AKQ2MMS: NUMBER OF MESSAGES EXCEEDS THE 270 ALLOWED LIMIT. PROGRAM TERMINATES.

Explanation: PPFA allows only 269 messages, plus this one. When this limit is reached, the messages are printed and the program terminates.

System action: The program terminates.

Operator response: Correct the PPFA code for the messages issued and redo.

AKQ301I: PAGE PRINTER FORMATTING AID ENDED, MAX RETURN CODE = (*max return code*).

Explanation: This message accompanies the output listings of all form definitions and page definitions with the maximum return code for that particular object. Only when the return code is less than 8 is the object generated.

System action: None.

Operator response: None.

AKQ302I: NO ERRORS FOUND IN (*resource name*) DEFINITION.

Explanation: One definition is processed. No statements were flagged in this definition.

System action: This definition is generated, and stored or replaced.

Operator response: None.

AKQ303S: NO CONTROL STATEMENT(S) ARE SPECIFIED IN INPUT DATA.

Explanation: There are no control statements in the input data.

System action: The operation terminates.

Operator response: Specify a valid PPFA command.

AKQ304S: DEFINITION STATEMENT IS NOT SPECIFIED.

Explanation: There is no FORMDEF or PAGEDEF command in the system input command stream.

System action: The operation terminates.

Operator response: Specify valid definition commands.

AKQ305S: THIS DEFINITION IS NOT STORED BECAUSE MEMBER ALREADY EXISTS.

Explanation: This form definition or page definition is not saved because a file with the same name already exists in the directory (REPLACE option is NO).

System action: A page definition or form definition is not generated. The syntax check continues to next definition.

Operator response: Check the specified form definition or page definition name, and specify REPLACE subcommand YES. Specify another form definition or page definition name.

AKQ311I: FORMDEF (*form definition name*) IS GENERATED AND STORED. MAX RETURN CODE = (*max return code*).

Explanation: The form definition is generated and stored.

System action: A form definition is generated.

Operator response: None.

AKQ312I: FORMDEF (*command name*) IS GENERATED AND REPLACED. MAX RETURN CODE = (*max return code*).

Explanation: The form definition is generated and is replaced. The maximum return code is listed.

System action: A form definition is generated.

Operator response: None.

AKQ313E: FORMDEF (*form definition name*) IS NOT GENERATED. MAX RETURN CODE = (*max return code*).

Explanation: The form definition is not generated because of an error. The error is indicated by another message.

System action: A form definition is not generated.

Operator response: Correct the error.

AKQ321I: PAGEDEF (*page definition name*) IS GENERATED AND FILED. MAX RETURN CODE = (*max return code*).

Explanation: The page definition is generated and stored.

System action: A page definition is generated.

Operator response: None.

AKQ322I: PAGEDEF (*page definition name*) IS GENERATED AND REPLACED. MAX RETURN CODE = (*max return code*).

Explanation: The page definition is generated and is replaced.

System action: A page definition is generated.

Operator response: None.

AKQ323E: PAGEDEF (*page-definition name*) IS NOT GENERATED. MAX RETURN CODE = (*max return code*).

Explanation: The page definition is not generated because of an error. The error is indicated by another message.

System action: A page definition is not generated.

Operator response: Correct the error.

AKQ350T: AN UNRECOVERABLE PROGRAM ERROR OCCURRED.

Explanation: There was an error in PPFA logic.

System action: The operation terminates.

Operator response: Use local problem-reporting procedures to report this message.

AKQ360E: FONT COMMAND DOES NOT CONTAIN SUFFICIENT INFORMATION.

Explanation: The FONT command referred to does not contain enough information to generate a valid MCF. This is caused by having a CS parameter without a CP parameter, or vice versa.

System action: A page definition is not generated.

Operator response: Correct the referenced FONT command.

AKQ361E: FONT COMMAND SPECIFIES CONFLICTING PARAMETERS.

Explanation: A FONT is specified in more than one way, only one of the following is allowed:

Coded Font

Character Set, Code Page pair (CS and CP parameters)

GRID

System action: A page definition is not generated.

Operator response: Correct the referenced FONT command.

AKQ362E: FONT RATIO SPECIFIED WITHOUT FONT HEIGHT.

Explanation: To scale a font, both the HEIGHT and RATIO **must** be specified. If a RATIO subcommand is found without a HEIGHT subcommand, the scaling information can not be calculated by PPFA.

System action: A page definition is not generated.

Operator response: Correct the referenced FONT command.

AKQ363W: HEIGHT SPECIFIED, WIDTH IN GRID IGNORED.

Explanation: You have specified both a HEIGHT and GRID in the FONT command.

System action: None.

Operator response: Correct the referenced FONT command.

AKQ364E: INVALID DIRECTION WITH RELATIVE PRINTLINE.

Explanation: You specified an incorrect direction with the relative printline in your page definition source. The field direction must match the direction of the printline. The printline direction must be ACROSS.

System action: A page definition is not generated.

Operator response: Correct the referenced DIRECTION subcommand.

AKQ365W: COLOR AND EXTENDED COLOR SPECIFIED.

Explanation: Both COLOR and one of the extended color keywords (RGB, CMYK, HIGHLIGHT, CIELAB) was specified.

System action: Both requests are placed into the output resource. Output depends on printer function.

Operator response: If output does not print as expected, remove one of the specifications.

AKQ370E: BARCODE NAME WAS NOT PREVIOUSLY DEFINED.

Explanation: You attempted to reference a barcode name that had not been previously defined.

System action: A page definition is not generated.

Operator response: Correct the referenced BARCODE subcommand of the FIELD command.

AKQ371E: BARCODE NAME WAS PREVIOUSLY DEFINED.

Explanation: You attempted to define a barcode name that had been previously defined.

System action: A page definition is not generated.

Operator response: Correct the referenced BARCODE subcommand of the FIELD command.

AKQ372W: BARCODE MODIFICATION UNDEFINED FOR TYPE GIVEN.

Explanation: You specified a modification for a bar code that is not defined for the type specified.

See [More About Bar Code Parameters, p. 452](#) for more information.

System action: A page definition is generated as specified. This is done so that, as new bar code types and modifications are introduced, you can create page definitions for them. However, you will receive this warning, because the specification could also be an error.

Operator response: Correct the referenced BARCODE subcommand of the FIELD command, if appropriate.

AKQ373W: BARCODE TYPE IS UNDEFINED.

Explanation: You specified a bar code type that is not defined.

System action: A page definition is generated as specified. This is done so that, as new bar code types and modifications are introduced, you can create page definitions for them. However, you will receive this warning, because this specification could also be an error.

Operator response: Correct the referenced BARCODE subcommand of the FIELD command, if appropriate.

AKQ374W: INVALID DATA LENGTH FOR SELECTED BARCODE TYPE AND MODIFICATION.

Explanation: You specified a data length for a defined barcode type and modification that is invalid for that combination of type and modification. When extra control characters are used as in the case of QRCode SOSI data, the data after translation might not exceed the limit. See [More About Bar Code Parameters, p. 452](#) for more information.

System action: A page definition is generated as specified. This is done so that, as new bar code types and modifications are introduced, you can create page definitions for them. However, you will receive this warning, because this specification could also be an error.

Operator response: Correct the referenced BARCODE subcommand of the FIELD command, if appropriate.

AKQ401E: EXEC PARAMETER IS INVALID.

Explanation: The program parameter specification is invalid.

System action: A page definition or form definition is not generated. The syntax check continues.

Operator response: Specify a valid program parameter.

AKQ402T: ERROR OCCURRED DURING ATTEMPT TO OBTAIN STORAGE.

Explanation: conditions generate this message:

1. Exceeds the available size to hold the compiled data for the page definition and form definition.
2. Insufficient available disk space on the file system to write the output of the compiler.
3. Exceeds the limit of 269 user errors generated within a PPFA source file.

System action: The operation terminated.

Operator response:

1. Increase the region or VM program size.
2. Increase the size of the file system or specify a directory on another file system that has more disk space.
3. Fix the errors reported to this point and re-run PPFA.

AKQ403T: ERROR OCCURRED DURING ATTEMPT TO FREE STORAGE.

Explanation: A system error occurred while PPFA attempted to free disk space at the end of an execution.

System action: The operation terminates.

Operator response: Use local problem-reporting procedures to report this message.

AKQ404T: SYSIPT OPEN FAILURE.

Explanation: SYSIPT cannot be opened.

System action: The operation terminates.

Operator response: Assign a valid input data file.

AKQ405T: INSUFFICIENT STORAGE TO EXECUTE PPFA.

Explanation: The region size is too small to execute PPFA.

System action: The operation terminates.

Operator response: Increase the region size available to the job.

AKQ410T: (Librarian error message).

Explanation: The message describes a librarian error.

System action: The operation terminates.

Operator response: Contact a system programmer.

AKQ411T: FORMDEF LIBRARY OPEN FAILURE.

Explanation: The FORMDEF library cannot be opened.

System action: The operation terminates.

Operator response: Assign a valid FORMDEF library.

AKQ412T: FORMDEF LIBRARY I/O ERROR.

Explanation: An I/O error occurred during an attempted access of a form definition directory.

System action: The operation terminates.

Operator response: Check the permissions of the directory. If you do not have access, contact the owner of the directory. If this does not resolve the problem, contact a system programmer.

AKQ413T: FORMDEF DIRECTORY CANNOT BE UPDATED.

Explanation: The FORMDEF member cannot be registered on the directory.

System action: The operation terminates.

Operator response: Contact a system programmer.

AKQ414T: FORMDEF LIBRARY CLOSE FAILURE.

Explanation: A form definition directory cannot be closed.

System action: The operation terminates.

Operator response: Use local problem-reporting procedures to report this message.

AKQ415T: PAGEDEF LIBRARY OPEN FAILURE.

Explanation: The PAGEDEF library cannot be opened.

System action: The operation terminates.

Operator response: Assign a valid PAGEDEF library.

AKQ416T: PAGEDEF LIBRARY I/O ERROR.

Explanation: I/O error occurs during an attempted access of a page definition directory.

System action: The operation terminates.

Operator response: Check the permissions of the directory. If you do not have access, contact the owner of the directory. If this does not resolve the problem, contact a system programmer.

AKQ417T: PAGEDEF DIRECTORY CANNOT BE UPDATED.

Explanation: A page definition file cannot be registered on the directory.

System action: The operation terminates.

Operator response: Contact a system programmer.

AKQ418T: PAGEDEF LIBRARY CLOSE FAILURE.

Explanation: A page definition directory cannot be closed.

System action: The operation terminates.

Operator response: Use local problem-reporting procedures to report this message.

AKQ420T: SYSTEM ERROR. ABEND CODE = (ABEND *code*).

Explanation: System forces PPFA to terminate abnormally.

System action: The operation terminates.

Operator response: Contact a system programmer. Refer to the documentation for your operating system.

AKQ421T: FORMDEF LIBRARY IS FULL.

Explanation: The file system into which PPFA attempted to save the form definition is full.

System action: The operation terminates.

Operator response: Increase the size of the file system or specify a directory on a file system that has more disk space.

AKQ422T: PAGEDEF LIBRARY IS FULL.

Explanation: The file system into which PPFA attempted to save the page definition is full.

System action: The operation terminates.

Operator response: Increase the size of the file system or specify a directory on a file system that has more disk space.

3

AKQ501T: SYSIN OPEN FAILURE.

Explanation: The PPFA input source file cannot be opened.

System action: The operation terminates.

Operator response: Specify a valid input source file.

AKQ502T: SPANNED RECORD OF SYSIN IS NOT SUPPORTED.

Explanation: The spanned record of the PPFA input source file is not supported.

System action: The operation terminates.

Operator response: Specify a valid input record format.

AKQ503T: UNDEFINED LENGTH RECORD OF SYSIN IS NOT SUPPORTED.

Explanation: An undefined length record of PPFA input source file is not supported.

System action: The operation terminates.

Operator response: Specify a valid input record format.

AKQ504T: LOGICAL RECORD LENGTH OF SYSIN EXCEEDS LIMIT.

Explanation: The logical record length of the PPFA input source file exceeds limit which is 100 bytes except for the OS/390 variable length which is 104 and AIX which is 254.

System action: The operation terminates.

Operator response: Correct the logical record length of the file.

AKQ510T: FORMDEF/PAGEDEF LIBRARY OPEN FAILURE.

Explanation: The FORMDEF or PAGEDEF directory cannot be opened.

System action: The operation terminates.

Operator response: Specify a valid FORMDEF or PAGEDEF or check to make sure that the directory is correct.

AKQ511T: I/O ERROR OCCURRED DURING (FORMDEF/PAGEDEF) DIRECTORY SEARCH. RETURN CODE = (*return code*) REASON CODE = (*reason code*)

Explanation: I/O error occurred while performing FIND function.

System action: The operation terminates.

Operator response: Contact a system programmer.

AKQ512T: LOGICAL RECORD LENGTH OF FORMDEF/PAGEDEF EXCEEDS LIMIT.

Explanation: The logical record length exceeds maximum or minimum value.

System action: The operation terminates.

Operator response: Specify a filename that has a valid record length.

AKQ513T: BLOCK SIZE OF FORMDEF/PAGEDEF EXCEEDS LIMIT.

Explanation: The block size exceeds maximum or minimum value.

System action: The operation terminates.

Operator response: Assign a filename that has a valid block size.

AKQ514T: UNDEFINED LENGTH RECORD IS NOT SUPPORTED IN FORMDEF/PAGEDEF LIBRARY.

Explanation: An undefined length record is not supported in FORMDEF/PAGEDEF directory.

System action: The operation terminates.

Operator response: Assign a valid record format.

AKQ515T: FIXED LENGTH RECORD IS NOT SUPPORTED IN FORMDEF/PAGEDEF LIBRARY.

Explanation: The fixed length record is not supported in the FORMDEF or PAGEDEF library.

System action: The operation terminates.

Operator response: Assign a valid record format.

AKQ516T: NO CONTROL CHARACTER RECORD IS SUPPORTED IN FORMDEF/PAGEDEF LIBRARY..

Explanation: No control character record is supported in FORMDEF/PAGEDEF directory.

System action: The operation terminates.

Operator response: Assign a valid record format.

AKQ517T: NO SPACE IN FORMDEF/PAGEDEF DIRECTORY.

Explanation: No space was available in the FORMDEF directory or the PAGEDEF directory to add or replace the resource.

System action: The operation terminates.

Operator response: Increase the directory space or specify a directory on another file system that has more disk space.

AKQ518T: I/O ERROR OCCURRED WHILE UPDATING FORMDEF/PAGEDEF DIRECTORY. RETURN CODE = (*return code*). REASON CODE = (*reason code*).

Explanation: A permanent I/O error was detected, or the specified data control block is not opened, or insufficient disk space exists to perform the write function.

System action: The operation terminates.

Operator response: Contact a system programmer.

AKQ519T: I/O ERROR OCCURRED DURING WRITE.

Explanation: The error message is displayed.

System action: The operation terminates.

Operator response: Contact a system programmer.

AKQ520T: SPANNED RECORD IS NOT SUPPORTED IN FORMDEF/PAGEDEF LIBRARY.

Explanation: The spanned record is not supported in the FORMDEF or PAGEDEF library.

System action: The operation terminates.

Operator response: Remove the SPAN attribute and assign a valid dataset.

AKQ522T: BLOCK SIZE IS NOT SPECIFIED FOR FORMDEF/PAGEDEF DATA SET.

Explanation: A block size is not specified for FORMDEF/PAGEDEF data set.

System action: The operation terminates.

Operator response: Specify a BLKSIZE in the DD statement.

AKQ540T: SYSTEM ABEND (*code*) OCCURRED IN PPFA PROCESS.

Explanation: A system ABEND (*code*) occurred in PPFA/OS/390 process. Termination processing was performed by the ESTAE macro instruction.

System action: The operation terminates.

Operator response: Contact a system programmer. Refer to System Messages for your operating system.

AKQ541T: USER ABEND (*code*) OCCURRED IN PPFA/OS/390 PROCESS.

Explanation: A user ABEND (*code*) occurred in PPFA/OS/390 process. Termination processing was performed by the ESTAE macro instruction.

System action: The operation terminates.

Operator response: Use local problem-reporting procedures to report this message.

AKQ600T: INPUT FILENAME NOT SPECIFIED.

Explanation: You did not specify an input filename.

System action: The operation terminates.

Operator response: Enter the input filename.

AKQ601T: INPUT FILETYPE NOT SPECIFIED.

Explanation: You did not specify an input filetype.

System action: The operation terminates.

Operator response: Enter the input filetype.

AKQ602T: COMMAND SYNTAX IS NOT VALID.

Explanation: The command syntax you entered was not accepted.

System action: The operation terminates.

Operator response: Enter a valid command.

AKQ603T: FILEMODE FOR (FORMDEF/PAGEDEF/LISTING) IS INVALID.

Explanation: You entered an invalid filemode for FORMDEF, PAGEDEF, or LISTING.

System action: The operation terminates.

Operator response: Enter a valid file extension.

AKQ604T: INVALID PARAMETER IS SPECIFIED IN (FORMDEF/PAGEDEF/LISTING/SIZE) OPTION.

Explanation: You entered an invalid parameter for FORMDEF, PAGEDEF, LISTING, or SIZE.

System action: The operation terminates.

Operator response: Enter a valid option parameter.

AKQ605T: (FORMDEF/PAGEDEF/LISTING/SIZE) KEYWORD IS DUPLICATED.

Explanation: You entered a duplicate keyword for FORMDEF, PAGEDEF, LISTING, or SIZE.

System action: The operation terminates.

Operator response: Enter a unique keyword.

AKQ606T: FILETYPE FOR (FORMDEF/PAGEDEF/LISTING) NOT SPECIFIED.

Explanation: The filetype for FORMDEF, PAGEDEF, or LISTING was not entered.

System action: The operation terminates.

Operator response: Enter an appropriate filetype.

AKQ607T: INVALID KEYWORD SPECIFIED.

Explanation: The keyword you entered was not accepted.

System action: The operation terminates.

Operator response: Enter a valid keyword.

AKQ608T: INVALID SIZE PARAMETER SPECIFIED.

Explanation: The size parameter specified is not valid.

System action: The operation terminates.

Operator response: Enter a valid size parameter.

AKQ610T: SIZE PARAMETER VALUE EXCEEDS THE ALLOWABLE MAXIMUM.

Explanation: The size entered exceeds the maximum allowable.

System action: The operation terminates.

Operator response: Enter a valid size value.

AKQ611T: SIZE PARAMETER VALUE IS TOO SMALL.

Explanation: The size entered is too small for executing in PPFA/VM..

System action: The operation terminates.

Operator response: Enter a valid size value.

AKQ612T: INVALID FILE IDENTIFIER '*' SPECIFIED FOR INPUT FILE.

Explanation: '*' is specified for input filename or filetype.

System action: The operation terminates.

Operator response: Enter a valid filename or filetype.

AKQ613T: SIZE PARAMETER VALUE IS MISSING.

Explanation: You did not specify a size parameter.

System action: The operation terminates.

Operator response: Specify a valid size parameter.

AKQ620T: INPUT FILE WAS NOT FOUND.

Explanation: The input filename entered was not found.

System action: The operation terminates.

Operator response: Correct the input filename.

AKQ621T: NO READ/WRITE (file mode) DISK ACCESSED FOR (INPUT/LISTING/FORMDEF/PAGEDEF /OUTPUT).

Explanation: The disk on which the file is saved cannot be read from or written to because it either was not accessed or was accessed using an invalid access mode.

System action: The operation terminates.

Operator response: Access the file system using a valid access mode.

AKQ622T: INPUT FILE EXCEEDS THE ALLOWABLE LOGICAL RECORD LENGTH MAXIMUM.

Explanation: The logical record length of the input file exceeds the limit which is 100 bytes except the OS/390 variable record length is 104 and AIX is 254.

System action: The operation terminates.

Operator response: Correct the logical record length of the file.

AKQ624T: I/O ERROR OCCURRED IN (AKQINIO/AKQLBIO/AKQPRIO) MODULE. RC = (return code from FWRITE/FGETS macro instruction).

Explanation: An I/O error occurred during either FGETS or FWRITE processing of module AKQINIO, AKQLBIO, or AKQPRIO.

System action: The operation terminates.

Operator response: Contact your system programmer. Refer to the return code in *AIX Operating System Messages*.

AKQ625T: DISK (file mode) IS FULL.

Explanation: Not enough space is available on the specified file system to write the file.

System action: The operation terminates.

Operator response: Erase some files from the specified file disk and re-execute.

AKQ639T: ABEND EXIT ROUTINE FAILED TO EXECUTE. RC = (return code from ABNEXIT macro).

Explanation: ABEND exit routine cannot be established.

System action: The operation terminates.

Operator response: Contact your system programmer. Refer to the return code in *AIX Operating System Messages*.

AKQ640T: SYSTEM ABEND (code) OCCURRED IN PPFA/VM PROCESS.

Explanation: A system ABEND occurred during processing. The ABEND exit routine ended processing.

System action: The operation terminates.

Operator response: Use local problem-reporting procedures to report this message.

AKQ641T: USER ABEND (*code*) OCCURRED IN PPFA/VM PROCESS.

Explanation: A user-initiated ABEND occurred during processing. The ABEND exit routine ended the processing.

System action: The operation terminates.

Operator response: Use local problem-reporting procedures to report this message.

AKQ700I: SIZE PARAMETER IS NO LONGER NECESSARY IN PPFA/370.

Explanation: The storage required to contain the messages and control blocks is not automatically set at 32K and 128K respectively. If the control block storage is used up, an additional 128K will be gotten and chained to the previous. All storage necessary to perform the compile will be obtained during processing.

System action: The compile process continues.

Operator response: None.

Glossary

This glossary defines technical terms and abbreviations used in InfoPrint Manager.

Special Characters

.Guidefaults file

A file created by InfoPrint in the home directory of a person using the InfoPrint GUI. InfoPrint uses this file to save and reference information about the servers you are monitoring and the windows you are working in.

A

Access Control List (ACL)

In computer security, a collection of all access rights for one object.

ACL

Access Control List.

acl editor

A command line interface that lets you view, add, update, and delete access authorization records in an ACL.

action

In the InfoPrint GUI, an icon that represents an operation that you can perform on an InfoPrint object. You drag and drop the action onto an object to initiate the operation for that object. For example, using the `Enable` action to enable a disabled actual destination.

actual destination

In InfoPrint, an object that represents the output device that performs the printing or transmission function. See *email destination*; see also *physical printer*, *printer device*; contrast with *logical destination*.

additive color system

A system that reproduces an image by mixing (adding) appropriate quantities of red, green, and blue light (the additive primary colors) to create all other colors of light, either direct or transmitted. When the additive primaries are superimposed on one another, they create white light. Contrast with *subtractive color system*.

administrator

In InfoPrint, the person who creates and manages one or more components of a printing system, such as servers and actual destinations. By default, InfoPrint gives administrators authorization to perform some InfoPrint operations and to access certain information that is not available to the operators or job submitters.

Adobe Acrobat

An Adobe software program that provides instant access to documents in their original format, independent of computer platform. With the Adobe Reader, you can view, navigate, print, and present any Portable Document Format (.pdf) file.

Adobe PageMaker

A desktop publishing program that produces PostScript documents.

Adobe PostScript Raster to Image Transform (RIP)

See *raster image processor (RIP)*.

ADSM/6000

Advanced Distributed Storage Manager.

Advanced Distributed Storage Manager (ADSM/6000)

A program that provides storage management for archived files.

Advanced Function Common Control Unit (AFCCU)

A RISC-based control unit with code common to all printers that use the AFCCU.

Advanced Function Presentation (AFP)

A set of licensed programs, together with user applications, that use the all-points-addressable concept to print data on a wide variety of printers or to display data on a wide variety of display devices. AFP includes creating, formatting, archiving, retrieving, viewing, distributing, and printing information.

Advanced Function Presentation data stream (AFP data stream)

The printer data stream used for printing AFP data. The AFP data stream includes composed text, page segments, electronic overlays, form definitions, and fonts downloaded from the operating system to the printer.

A presentation data stream that is processed in AFP environments. The AFP data stream includes MO:DCA-P-based data streams.

Advanced Interactive Executive (AIX)

An operating system used with pSeries computers. The AIX operating system is IBM's implementation of the UNIX operating system.

AFCCU

Advanced Function Common Control Unit.

AFP

Advanced Function Presentation.

AFP data stream

Advanced Function Presentation data stream.

ainbe

The printer input/output backend program used by the PSF DSS to send jobs to printer devices. Depending on the incoming data stream of the job, the PSF DSS might have transformed the data stream of the job before the backend program sending it to the printer device.

AIX

Advanced Interactive Executive.

AIX-attached printer

A printer device, attached to an pSeries computer through the network or through a serial or parallel port that receives jobs from an AIX print queue.

In InfoPrint, a PSF physical printer that represents an AIX-attached printer device. See also *direct-attached printer*, *TCP/IP-attached printer*, *upload-TCP/IP-attached printer*.

AIX destination support system

In InfoPrint, the destination support system that communicates with the standard AIX print backend (`pio`), or with certain variations of the `rembak` print backend, to print jobs.

AIX physical printer

In InfoPrint, the object representing a printer device that uses the AIX destination support system.

aliasing

In a digitized image, the creation of diagonal lines by combining short horizontal and vertical line segments that approximate the path of the desired line.

all-points-addressability (APA)

The capability to address, reference, and position text, overlays, and images at any defined point of the printable area of the paper or display medium.

alphameric

Synonym for *alphanumeric*.

alphanumeric

Pertaining to a character set containing letters, digits, and other symbols such as punctuation marks. Synonymous with *alphameric*.

AMPV

Average monthly print volume.

analog

Pertaining to a continuous variable sampling of information between two points that achieves an even, smooth transition of photographic material.

analog color proof

An off-press color proof made from separation films.

anti-aliasing

The rendering of hard-edged objects so that they blend smoothly into the background. PhotoShop offers anti-aliasing when rasterizing an EPS file.

Removing the jagged "stairstep" quality in diagonal lines produced on a computer screen by aliasing. This removal is effected by creating less densely shaded fields parallel to the diagonal line.

APA

All-points-addressability.

API

Application Program Interface.

Application Program Interface (API)

The call interface between a client program and the procedures that implement the printing system, as defined by the specification. Clients use the API to access servers. (P)

architecture

The set of rules and conventions that govern the creation and control of data types such as text, image, graphics, font, color, audio, bar code, and multimedia.

archiving

The transfer of digital information from an online system onto floppy disk, compact disc, or other media for offline storage. The original copy is deleted from the online system. See also *retrieval*.

array inkjet

An ordered collection of multiple print heads used in an inkjet printer.

ASCII

American National Standard Code for Information Exchange. The standard code, using a coded character set consisting of 7-bit coded characters (8 bits including a parity check). The ASCII code is used for information exchange among data processing systems, data communications systems, and associated equipment. The ASCII character set includes control characters and graphic characters.

asynchronous

Pertaining to two or more processes that do not depend upon the occurrence of specific events, such as common timing signals. (T)

In InfoPrint, occurring without a regular or predictable time relationship to a specified action. Contrast with *synchronous*.

attachment type

Defines the method by which a printer device is attached to the AIX system from which it receives data. See *AIX-attached printer*, *direct-attached printer*, *TCP/IP-attached printer*, and *upload-TCP/IP-attached printer*.

attribute

A defined characteristic of an object, such as the number of copies required of a job, or the document formats accepted by an actual destination.

attribute name

A string that identifies an attribute. Typically, in InfoPrint attribute names consist of two or more words separated by hyphens.

attribute value

The element of an attribute that specifies the characteristics relating to the attribute.

authorization

In computer security, verification of the eligibility of a user to access an object.

authorized user

A person with the appropriate permissions to access an object or to issue a command.

automatic recovery

A function of printer logic that permits the printer to reprint a job if the job is misprinted or damaged or if a component has failed.

auxiliary sheet

In InfoPrint, an object that represents a particular sheet of paper, blank or otherwise, that can precede a job, separate documents in a job, or follow a job.

auxiliary-sheet selections

A particular combination of start, separator, and end sheets that print with jobs on a particular printer device.

B

backend

In AIX or Linux, the program that is invoked by the `qdaemon` process (AIX) or CUPS printing system (Linux) to run a print or batch job. Synonymous with *backend program*.

backend program

Synonym for *backend*.

backlog

In InfoPrint, the amount of time calculated by InfoPrint that is required to print all of the jobs currently in a queue.

backspace

In InfoPrint, the action used to back up and reprint pages in a job.

bar code

A code representing characters by sets of parallel bars of varying thickness and separation that are read optically by transverse scanning.

An array of parallel rectangular bars and spaces that together represent data elements or characters in a particular symbology. The bars and spaces are arranged in a predetermined pattern following unambiguous rules defined by the symbology.

BCOCA

Bar Code Object Content Architecture.

Bezier curves

A method of defining curves using anchor points, control handles, and tangent lines. The PostScript path passes through anchor points. Its approach direction is along the tangent lines that are controlled by the control handles. Many personal computer programs use this drawing method. Type 1 PostScript fonts are defined using Bezier curves.

binding

The cover and materials that hold a book together. See *edition binding*, *perfect binding*, *spiral binding*, *wire-o binding*.

The process of applying the binding to a book.

In InfoPrint, assigning a job to an actual destination. See *early binding*, *late binding*.

bitmapped

Pertaining to an image formed by a rectangular grid of pixels. Each pixel is assigned a value to denote its color. One-bit images are black and white; 8-bit images have 256 colors (or grays);

24-bit images have full color. CMYK images have 32-bits per pixel to encode 256 levels in each of four channels. Bitmapped images are also called raster images.

bleed

An extra amount of printed image that extends beyond the trim edge of the sheet. Bleed ensures that no white gap appears at the edge of the sheet.

boot

To prepare a computer for operating by loading an operating system.

BSD

Berkeley Software Distribution.

BSD destination support system

In InfoPrint, the destination support system that generates a print command string that the shell runs to print jobs.

BSD physical printer

In InfoPrint, the object representing a printer device that uses the BSD destination support system.

burn

In platemaking, an exposure. Burn is named because of the extremely bright ultraviolet lamps used to transfer images from film to plate.

In photography, to lengthen the final exposure time to increase the final density of print.

C**CDE**

Common Desktop Environment.

child

See *parent/child relationship*.

choke

In color printing, an area whose dimensions have been reduced to avoid overlapping another color. Contrast with *spread*.

class

Synonym for *object class*.

clean

In InfoPrint, an action used to remove all the jobs from specified servers, actual destinations, or queues, or to remove all the jobs submitted to specified logical destinations.

CLI

Command Line Interface.

client

In InfoPrint, the component of the print system that assembles a print request and submits the request to a server. The client generates the local ID numbers for each job, submits the jobs to the servers, and keeps track of where each user's jobs have been submitted.

CMR

Color Management Resource.

CMY

Cyan, magenta, yellow.

CMYK

Cyan, magenta, yellow, black.

collator

In some printers a special-purpose hard drive disk array used to store RIPped files and later transfer them to the LED print heads for imaging.

color balance

The relative levels of cyan, magenta, and yellow channels in an image to produce accurate color rendition of an original image.

color correction

The adjustment of the color balance in an image to produce accurate color rendition of an original image. Color correction is used for two- or three-spot-color jobs.

color key

A color proof similar to Cromalin, but typically not laminated and not necessarily accurate in color. Color keys are used to verify that breaks or color assignments and traps have been made accurately.

Color management resource

Color management resource (CMR) is an architected resource that is used to carry all of the color management information required to render a print file, document, group of pages or sheets, page, or data object with color fidelity.

Command Line Interface (CLI)

A type of user interface where commands are specified on the command line. Contrast with *Graphical User Interface*.

Common Desktop Environment (CDE)

A graphical user interface running on a UNIX operating system.

complex attribute

In InfoPrint, an attribute that can have multiple values with each value containing multiple components.

constant data

Data that does not change between copies of a document and that is merged with variable data to produce personalized documents. For example, a form letter (constant data) can be merged with a customer's name and address (variable data).

contextual help

A type of online help that provides specific information about each selectable object, menu choice, notebook tab, field, control, and pushbutton in a window.

control strip

A strip of information that can be attached to a print job and used to measure registration and density.

Cromalin

The Dupont color proofing system. Four layers (CMYK) of light-sensitive material are exposed through final halftone negative films, then laminated together on an opaque backing to produce a color- and trap-accurate final proof showing actual halftone dot structure. Cromalin is sometimes called an analog proof.

crop

To remove unwanted areas of an image, usually indicated by crop marks on the original.

CTS

Cutter-trimmer-stacker.

CUPS

Common Unix Printing System is a modular printing system for Unix-like computer operating systems which allows a computer to act as a print server. A computer running CUPS is a host that can accept print jobs from client computers, process them, and send them to the appropriate printer.

CUPS destination support system

In InfoPrint, the destination support system that communicates with the standard LINUX print system (CUPS) and that uses InfoPrint Manager **pioinfo** backend, InfoPrint Manager **piorpdm** backend for Ricoh printers or other print backends to print jobs.

cutter-trimmer-stacker (CTS)

A post-processing device attached to a printer device and used for paper handling.

cyan, magenta, yellow (CMY)

The subtractive primary colors.

cyan, magenta, yellow, black (CMYK)

The four basic colors used in offset printing, as opposed to the three basic colors of light: red, green, and blue. Magenta, yellow, and cyan are the subtractive primaries. Black is added to provide better density and to produce a true black.

D

daemon

A program that runs unattended to perform a standard service. Some daemons are triggered automatically to perform their tasks; others operate periodically. Daemon processes generally provide a service that must be available at all times to more than one task or user, such as sending data to a printer.

data stream

All information (data and control commands) sent over a data link.

A continuous stream of data that has a defined format.

In InfoPrint, pertaining to the incoming format of the job and the output format required by the printer device. InfoPrint transforms the incoming format into the output format, as required. See also *document format*.

DB2*/6000

DataBase 2/6000.

deadline

In InfoPrint, a queuing technique where the next job assigned to the first position in the queue is the one whose deadline is closest. Contrast with *FIFO (first-in-first-out)*, *job-priority*, *longest-job-first*, and *shortest-job-first*.

default document

In InfoPrint, an object that represents default attribute values for a document in a job. Synonymous with *initial value document*.

default job

In InfoPrint, an object that represents default attribute values for a job. Synonymous with *initial value job*.

default object

In InfoPrint, a general term that refers either to a *default document* or a *default job*. Synonymous with *initial value object*.

default value

A value stored in the system that is used when no other value is specified.

delete

In InfoPrint, an action used to delete default objects, jobs, logical destinations, actual destinations, or queues from the server.

desktop publishing

Performing print-related activities on a personal computer, including but not limited to layout, design, photo manipulation, creating fonts, editing text, color separation, scanning, and animation.

destination

See *actual destination*, *logical destination*.

destination support system (DSS)

In InfoPrint, the programs that an actual destination uses to communicate with the output device. Synonymous with *device support system*. See *AIX destination support system*, *BSD destination support system*, *email destination support system*, and *PSF destination support system*.

device

An individual piece of equipment (hardware) that attaches to a computer, such as a printer device.

device address

The identification of an input or output device by its channel and unit number.

device driver

A file that communicates with a specific device such as a printer, disk drive, or display. An application that sends output to a device controls the actions of the device through the device driver. See *printer driver*.

device support system (DSS)

Synonym for *destination support system*.

DFE

Digital Front End

DFE destination support system

In InfoPrint Manager, the destination support system that communicates with a DFE print server driving a Ricoh printer.

DFE printer

In InfoPrint Manager, the object representing a DFE print server driving a Ricoh printer.

DFS

Distributed File Service.

digital

Pertaining to data represented by digits, sometimes with special characters and the space character.

digital color proof

An off-press color proof made from a color printer attached to a computer.

digital printing

A filmless and plateless printing process in which digital data for each page is transferred directly to a light-sensitive drum and then to paper for a final image.

direct-attached printer

A printer device, attached to an pSeries computer through the network or through a serial or parallel port.

In InfoPrint, a PSF physical printer that represents a direct-attached printer device. See also *AIX-attached printer*, *TCP/IP-attached printer*, and *upload-TCP/IP-attached printer*.

disable

In InfoPrint, an action used to stop the acceptance of jobs on destinations, queues, or servers, or to stop writing information to logs.

distributed print system

A computer system with the ability to interchange print data and controls among different computing environments with the intent of printing the data on a different system from the one where the print request was generated. For example, in host-to-LAN distributed printing, data that is located on the host is printed on printers attached to a local area network.

dithering

A technique of filling the gap between two pixels with another pixel having an average value of the two to minimize the difference or to add detail to smooth the result.

document

In InfoPrint, an object representing a grouping of data in a job. A job can contain one or more documents. The documents in a job can differ from each other in some ways. For example, they can contain different data and can have different document formats. A document in a job can contain printable data or a resource that is not printable by itself. See *file-reference document*, *printable document*, and *resource document*.

document element

A portion of a document at least a single page in size.

document format

In InfoPrint, a document format describes the type of the data and control characters in the document, such as line data or PostScript. The format of the data determines which printer devices are capable of printing the document and whether InfoPrint must transform the format.

document identifier

A string that identifies a document in a job. It consists of a job ID followed by a period (.) and a document sequence number. For example, 12.2. Document sequence numbers are integers starting at 1.

Document Printing Application (DPA)

An ISO/IEC 10175 standard that addresses those aspects of document processing that enable users in a distributed open systems environment to send electronic documents to shared, possibly geographically-dispersed printers. InfoPrint supports the DPA standard.

document transfer method

In InfoPrint, the transfer method describes how documents are transferred to, or acquired by, servers. See *pipe-pull* and *with-request*.

document type

In InfoPrint, the document type describes the kind of data in the document. A *printable document* can only contain printable data. A *resource document* can only contain data such as fonts or form definitions that are not printable. A *file reference document* can only contain names of files entered on separate lines.

dot

The individual elements of a halftone.

dot gain

An increase in the size of a halftone dot during printing, caused by ink spreading. Generally, this value is known precisely, and the scanning and filming production process is calibrated to compensate for it. The Cromalin proofing system simulates this effect.

dots per inch (dpi)

A measure of data density per unit distance. Typical values for desktop publishing range from 200 to 300 dpi.

DPA

Document Printing Application.

DPF

Distributed Print Facility.

dpi

Dots per inch.

drag and drop

In graphical user interfaces, a procedure by which you perform actions and tasks. Using the mouse, you drag (move) an action or object icon to a new position where you want the action or task to occur.

DSS

Destination support system.

dummy

A rough paste-up or hand-drawn representation of the anticipated finished product. A dummy is used for basic design and pagination.

duplex printing

Printing on both sides of the paper. Contrast with *simplex printing (1)*.

Printing on both sides of the paper, placing output images on the media in a head-to-head format, so that the top of one image is at the same edge as the top of the next image. Contrast with *tumble duplex printing*; see also *simplex printing (2)*.

E**early binding**

In InfoPrint, assigning a job to an actual destination as soon as it is accepted. Early binding permits InfoPrint to estimate the time when the job will be completed. Contrast with *late binding*.

edition binding

A type of book binding in which printed sheets are folded into 16- or 32-page signatures. Four-page endleaves are pasted on the outside of the first and last signature. The signatures are then collated by machine and sewn together using special sewing machines. Contrast with *perfect binding*, *spiral binding*, and *wire-o binding*.

electronic document

A document stored in a computer instead of printed on paper.

electronic mail

Correspondence in the form of messages sent between workstations over a network. Synonymous with *email*.

electrophotographic

Pertaining to a type of printer technology that creates an image on paper by uniformly charging the photoconductor, creating an electrostatic image on the photoconductor, attracting negatively charged toner to the discharged areas of the photoconductor, and transferring and fusing the toner to paper.

em

In composition, a unit of measurement exactly as wide and as high as the point size of the font being set. The name is derived from the fact that the letter M in early typefaces was usually cast on a square body.

email

Electronic mail.

email destination

In InfoPrint, an actual destination representing an electronic mailing system.

email destination support system

In InfoPrint, the destination support system that supports email destinations.

embellishments

Variable data added to all copies of assembled pages to make the unit appear like a whole; for example, headers, footers, a table of contents, and chapter separations.

en

In composition, exactly one-half an em.

enable

In InfoPrint, the action that makes a destination, queue, or server able to accept jobs, or a log able to accept information.

end sheet

The sheet of paper, blank or otherwise, that can follow a job. See also *auxiliary sheet*.

Enhanced X-Windows

A tool designed to permit multiple application processes to operate in multiple windows displayed on a virtual terminal. See *X-Windows*.

environment variable

Any one of a number of variables that describe the way an operating system runs and the devices it recognizes.

error log

A data set or file in a product or system where error information is stored for later access.

estimate

The professional cost analysis made by a print shop in response to a customer's request for a price quotation on a print job.

event

In InfoPrint, an occurrence in the printing system during an operation; for example, the completion of a command.

event log

In InfoPrint, a collection of messages about events that have occurred.

event notification

The notification that is sent by InfoPrint for an event.

F

Federated Authentication

A technology that grants users secure access to InfoPrint Manager relying on external identity providers (IdPs). Instead of managing separate user credentials within the InfoPrint Manager system, federated authentication allows users to log in using their existing accounts from trusted third-party services.

FIFO (first-in-first-out)

In InfoPrint, a queuing technique where the next job assigned to the first position in the queue is the job that has been in the queue for the longest time. InfoPrint processes jobs in the order in which they are received. Contrast with *deadline*, *job-priority*, *longest-job-first*, and *shortest-job-first*.

file-reference document

In InfoPrint, a file containing the names of other files, each entered on a separate line. Job submitters can specify this file for printing when they specify a document type of *file-reference*; InfoPrint prints each file listed in the reference document.

File Transfer Protocol (FTP)

In TCP/IP, the application protocol that makes it possible to transfer data to and from host computers and to use foreign hosts indirectly.

finisher

A hardware device attached to a printer that performs such operations as folding or stapling the printed pages.

finishing

In a print shop, the final operations on a printed product, such as stapling, trimming, drilling, folding, embossing, varnishing, gluing, shrink wrapping, perforating, laminating, collating, and so on.

flag

A modifier of a command that specifies the action of the command. A dash usually precedes a flag. Synonymous with *option*. See also *keyword*.

FOCA

Font object content architecture.

folder

In the InfoPrint GUI, an object that represents a container for a collection of similar objects. For example, the Retained Jobs folder contains retained jobs.

font

A family of characters of a given size and style; for example, 9-point Helvetica.

One size and one typeface in a particular type family, including letters, numerals, punctuation marks, special characters, and ligatures.

A paired character set and code page that can be used together for printing a string of text characters. A double-byte font can consist of multiple pairs of character sets and code pages.

form definition

A resource object used by InfoPrint that defines the characteristics of the form or printed media, which include: overlays to be used, the paper source (for cut-sheet printers), duplex printing, text suppression, and the position of composed-text data on the form.

forward space

In InfoPrint, the action used to move ahead and skip the printing of a specified number of pages in a job.

FPO

Low-quality (sometimes photographic) images placed in a dummy to represent final images. Desktop publishing software produces images as display-screen resolution FPOs.

front panel

In the CDE, a workspace area containing controls that represent various tasks you can perform and workspace switches.

FST

Files and Sockets Transport is the local security implementation for InfoPrint Manager. It uses the local namespace for user credentials, and it is a lightweight security protocol.

FTP

File Transfer Protocol.

G

GCR

Gray component replacement.

GIF

Graphics Interchange Format.

global change

In the InfoPrint GUI, an action used to make changes to one or more attributes of several objects at once. You can also perform the same action on several objects of the same object class at the same time; for example, disabling two or more actual destinations at the same time.

global character

A character or set of characters used to specify an unknown number or set of characters in a search string. In InfoPrint, a global character is represented by an asterisk (*).

global ID

Global job identifier.

global job identifier

An unambiguous job identifier. In InfoPrint, it is represented as the name of the server managing the job followed by a colon (:) and a generated integer. This ID uniquely identifies the job in the InfoPrint server.

glyph

An image, usually of a character, in a font.

GOCA

Graphics object content architecture.

graphic character

A visual representation of a character, other than a control character, that is normally produced by writing, printing, or displaying.

Graphical User Interface (GUI)

A type of user interface that takes advantage of a high-resolution monitor and includes a combination of graphics to implement an object-action paradigm, the use of pointing devices, menu bars, overlapping windows, and icons. Contrast with *Command Line Interface*.

Graphics Interchange Format (GIF)

A compressed graphics format widely used on the Internet.

gray component replacement (GCR)

Synonym for *under color removal (UCR)*.

gray scale

A strip of standard gray tones, ranging from white to black, placed at the side of the original copy during photography to measure the tonal range and contrast obtained.

GUI

Graphical User Interface.

gutter

The blank area or inner margin from the printing area to the binding.

H

halftone

A printing method that simulates continuous-tone shading using dots of varying sizes laid out on a rectangular grid. Larger dots simulate darker tones and smaller dots simulate lighter tones. Typical grid spacings are 85 lines per inch (lpi) (newspaper), 133 lpi (low end), 150 lpi (midrange), and 175+ lpi (high quality).

help

In the InfoPrint GUI, an action used to display the online help for a specific template, object, action, button, control, or area in an application window.

The name of a button used to access the online help.

hold

An indication determined by the **job-hold** attribute that is used to keep a job in the queue and prevent InfoPrint from scheduling it.

hostname

The name given to an AIX system.

hot folder

A workstation directory where users copy jobs to submit them to print.

hypertext

A way of presenting information online with connections between one piece of information and another. These connections are called hypertext links. See also *hypertext link*.

hypertext link

A connection between one piece of information and another. Selecting a link displays the target piece of information.

I**icon**

A graphic symbol displayed on a screen that a user can click to invoke a function or software application.

image

Toned and untoned pels arranged in a pattern.

image data

Rectangular arrays of raster information that define an image.

imagesetter

A high resolution (1270–3600+ dpi) printer that uses an Argon (green) laser to write to film using digital input. Imagesetting is the step before Cromalin proofing and platemaking.

imposition

The process of arranging pages on a press sheet to ensure the correct order during final cutting, folding, and binding. Electronic imposition builds press sheets automatically during the RIP and outputs film formatted for immediate use in platemaking.

InfoPrint

A solution of software and hardware products that can supplement or replace the offset presses and copiers in print shops with high-quality, non-impact, black and white or process color printers. InfoPrint takes documents from creation to the published, kitted, and shipped product.

In InfoPrint software publications, InfoPrint Manager for AIX or any of its components.

InfoPrint Manager for AIX

The software component of InfoPrint. InfoPrint Manager for AIX handles the scheduling, archiving, retrieving, and assembly of a print job and its related resource files. It also tracks the finishing and packaging of the printed product.

InfoPrint Manager for AIX is based on Palladium technology developed at MIT/Project Athena. It conforms to the ISO DPA and POSIX standards.

InfoPrint Network

The local area network running TCP/IP protocol that InfoPrint uses to communicate among servers, clients, and output devices.

InfoPrint Select

The component of InfoPrint Manager for AIX that lets you submit jobs from a Windows workstation.

InfoPrint Submit Express

The component of InfoPrint Manager that lets you submit jobs with a job ticket from a Windows or Macintosh workstation.

InfoPrint 20

A black and white, large-format, cut-sheet, workgroup laser printer with optional duplexing and 600-dpi resolution.

InfoPrint 60

A duplex, black and white, cut-sheet printer with 600-dpi resolution.

InfoPrint 62

A non-impact, continuous-forms printer that runs at a maximum of 62 impressions-per-minute (depending on forms size), and is factory set to run at either 240 or 300 dpi on a maximum paper size of 370.8 mm (14.6 in.).

InfoPrint 4000

A duplex, black and white, continuous-forms printer with 600-dpi resolution.

initial value document

Synonym for *default document*.

initial value job

Synonym for *default job*.

initial value object

Synonym for *default object*.

initially settable attribute

An attribute whose value can be established when an object is created but cannot be subsequently set or modified. See also *resettable attribute*; contrast with *non-settable attribute*.

input focus

The area of a window where user interaction is possible from either the keyboard or the mouse.

input tray

For a printer device, the container that holds the medium upon which the printer prints its output.

Intelligent Printer Data Stream (IPDS)

An all-points-addressable data stream that enables users to position text, images, and graphics at any defined point on a printed page.

Information that the host sends to IPDS printers. This information generally contains basic formatting, error recovery, and character data and enables the printers to make decisions.

An architected host-to-printer data stream that contains both data (text, image, graphics, and bar codes) and controls defining how the data is to be presented. IPDS provides a device-independent interface for controlling and managing all-points-addressable (APA) printers.

International Organization for Standardization (ISO)

An organization of national standards bodies from various countries established to promote development standards to facilitate international exchange of goods and services, and develop cooperation in intellectual, scientific, technological, and economic activity.

Internet

A wide area network connecting thousands of disparate networks in industry, education, government, and research. The Internet network uses TCP/IP as the protocol for sending information.

Internet Protocol

The set of rules that determines how to route data from its source to its destination in an internet environment.

intervening jobs

In InfoPrint, the number of jobs in a queue that are scheduled to print before the job in question.

IOCA

Image object content architecture.

IP address

The IPv4 or IPv6 address.

IPDS

Intelligent Printer Data Stream.

ISO

International Organization for Standardization.

J

job

In InfoPrint, an object that represents a request to print or send one or more documents together in a single session. A job includes the data to be printed or sent and resources such as fonts, images, and overlays. Depending on how it was submitted, it can also include a job ticket. Synonymous with *job bundle* and *print job*.

job bundle

Synonym for *job*.

job data

The page descriptions, merge data, and embellishments that compose a document in a job, either directly or by reference.

job ID

A local or a global identifier that identifies a job to a job submitter, administrator, operator, or InfoPrint. See *local job identifier*, *global job identifier*.

job-priority

In InfoPrint, a queuing technique where the next job assigned to the first position in the queue is the one with the highest priority. Contrast with *deadline*, *FIFO (first-in-first-out)*, *longest-job-first*, and *shortest-job-first*.

job submitter

In InfoPrint, the person who submits jobs for printing. Often, this person is an application programmer who maintains applications that generate data to be printed.

job ticket

The customer's hardcopy or electronic instructions listing all the variables describing a print job, either directly or by reference. The print shop can add specifications to the job ticket and can print the job ticket.

Joint Photographic Experts Group (JPEG)

A compressed graphics format widely used on the Internet.

JPEG

Joint Photographic Experts Group.

K

kerning

In typesetting, adjusting the relative spacing of two characters to improve their appearance and readability. Kerning pairs are specific sets of characters with built-in relative spacing. Some typefaces have as many as 100 kerning pairs.

keyword

A name or symbol that identifies a parameter.

Part of a command operand that consists of a specific character string, such as `DSNAME=`.

kitting

In a print shop, packaging the completed published work with attendant binders, tabs, diskettes, and other equipment or information, before shipping the finished product.

L

LAN

Local Area Network.

laser (light amplification by stimulated emission of radiation)

In InfoPrint printers, a device that emits a beam of coherent light that forms the image on the photoconductor that is subsequently transferred to the paper.

late binding

In InfoPrint, waiting to assign a job to an actual destination until it is about to be processed. Late binding permits InfoPrint to route a job to the first suitable actual destination that becomes available. Contrast with *early binding*.

LDAP

Lightweight Directory Access Protocol is the network security implementation for InfoPrint Manager. It uses an LDAP or Active Directory server for user credentials, and it offers a unified security implementation in a customer environment.

LED

Light-emitting diode.

light-emitting diode (LED)

The imaging device element for electrophotographic print units.

lines per inch (lpi)

A measure of the density of the grid used to space halftone dots. Typical grid spacings are 85 lpi (newspaper), 133 lpi (low end), 150 lpi (midrange), and 175+ lpi (high quality).

Linux

Linux is an open-source operating system modeled on UNIX. There are multiple distributions available, InfoPrint Manager is only supported on Red Hat Enterprise Linux (RHEL) and SUSE Linux Enterprise Server (SLES).

Local Area Network (LAN)

A computer network at one location that consisting of devices connected to one another and communicating. This network can also be connected to a larger network.

local ID

Local job identifier.

local job identifier

In InfoPrint, a job identifier automatically generated by the server, identifying the job to the person who submitted it. InfoPrint maps a local job ID to a global job ID.

locale

The human language and character set of information presented to a user.

In InfoPrint, the language InfoPrint uses when sending notification and error messages or displaying the InfoPrint graphical user interfaces.

log

A collection of messages or message segments added to a file for accounting or data collection purposes.

To record messages in a file.

logical destination

In InfoPrint, an object to which users submit their jobs. The logical destination routes jobs to one or more actual destinations representing output devices such as printers, or electronic mail systems. See also *logical printer*; contrast with *actual destination*.

logical printer

In InfoPrint, a type of logical destination. The logical printer routes jobs to one or more physical printers representing printing devices.

logical unit (LU)

A type of network accessible unit that enables end users to gain access to network resources and communicate with each other.

logical unit (LU) 6.2

A type of logical unit that supports general communication between programs in a distributed processing environment. LU 6.2 is characterized by (a) a peer relationship between session partners, (b) efficient utilization of a session for multiple transactions, (c) comprehensive end-to-end error processing, and (d) a generic application program interface (API) consisting of structured verbs that are mapped into a product implementation.

longest-job-first

In InfoPrint, a queuing technique where the next job assigned to the first position in the queue is the longest job in the queue. Contrast with *deadline*, *FIFO (first-in-first-out)*, *job-priority*, and *shortest-job-first*.

lpi

Lines per inch.

LU

Logical unit.

M

magnetic ink character recognition (MICR)

Identification of characters printed with ink that contains particles of magnetic material.

mainframe processor

A functional unit that interprets and executes instructions in a large computer to which other computers are connected so that they can share the facilities the mainframe provides.

makeready

All the setup work involved in preparing a press for a print run.

manage

In the InfoPrint GUI, the action used to put an object into a mode where its icon reflects changes of status.

mechanical

A camera-ready layout. The mechanical can consist of multiple sheets or overlays for each spot or process color used. Final images, if not stripped in later, should be at final size, cropped and screened to the correct line frequency.

medium

In InfoPrint, an object representing the physical material upon which a job is printed.

merge data

Data that is unique to each copy of a document and that customizes the document; for example, serial numbers or mailing information. Merge data is typically a small percentage of the total data in the document.

message catalog

A file of all the possible messages than can display during the processing of an application.

MICR

Magnetic ink character recognition.

Mixed Object Document Content Architecture (MO:DCA)

An architected, device-independent data stream for interchanging documents.

MO:DCA-P

Mixed Object Document Content Architecture Presentation.

modify

In InfoPrint, an action used to modify the values of attributes in the object attributes notebook.

moire

Undesirable interference patterns caused by two overprinting halftone screens with incorrect halftone dot angles.

monospaced

In typesetting, pertaining to a typeface in which all the characters have equal widths. Monospaced typefaces are useful for tabulating figures.

Multiple Virtual Storage (MVS)

An operating system developed by IBM. The design of MVS incorporates an addressing architecture that provides a unique address space to each job in the system.

MVS

Multiple Virtual Storage.

N

N_UP

Pertaining to the number of forms placed together in a layout. Typical layouts are 2_UP, 4_UP, 8_UP, 16_UP, and so on. N_UP printing is done to use the maximum area of the print sheet.

namespace

A global name repository available to all utilities and API procedures. The namespace contains mappings of object names to other related objects. For example, the namespace provides the mapping of a logical destination to the server in which it is located.

Network File System (NFS)

A protocol developed by Sun Microsystems that uses Internet Protocol to allow a set of cooperating computers to access each other's file systems as if they were local.

newline options

The different ways in which the printer determines how lines are delimited in a document data stream.

NFS

Network File System.

non-process-runout (NPRO)

A printer function that moves the last printed sheet to the stacker of the printer device.

non-settable attribute

An attribute that is neither initially settable nor resettable. The values for these attributes are controlled by InfoPrint. Contrast with *initially settable attribute* and *resettable attribute*.

notification

The act of reporting the occurrence of events.

In InfoPrint, notification of events appears as messages in event logs or messages sent to administrators, operators, and job submitters. In the InfoPrint GUI, notification of events also appears as changes to the appearance of icons.

notification-profile

In InfoPrint, an attribute associated with an object that contains information designating the people to whom InfoPrint sends notification about events for that object, which event information it sends, and how it sends the information.

NPRO

Non-process-runout.

O

object

A collection of attributes that represent a physical or logical entity in the print system. For example, a specific printer device is represented by an actual destination (physical printer) object. An object is identified by its object name. Objects are grouped into classes. See also *object class*.

object class

A group of objects that share a common definition and therefore share common properties, operations, and behavior as defined by their attributes. For example, all InfoPrint queue objects are in the same object class and each queue has the same set of queue attributes. However, the values for those attributes can differ for each queue in the queue object class.

Object Identifier (OID)

In architecture, a notation that assigns a globally unambiguous identifier to an object or a document component. The notation is defined in international standard ISO.IEC 8824(E).

object name

The alphanumeric term that identifies an object.

object state

The state of an object indicates its availability and readiness for performing its functions. An object can be in one of a number of states such as ready, busy, or unknown.

OCR

Optical character recognition.

octet

A byte that consists of eight binary digits (bits).

offset stacking

In certain printer devices, a function that allows the printer to offset the printed output pages for easy separation of the jobs.

OID

Object Identifier.

open destinations window

In the InfoPrint GUI, the action used to open a new application window displaying the logical and actual destinations associated with a queue.

Open Prepress Interface (OPI)

An industry standard for replacing low-resolution images in review documents with high-resolution images needed for high-quality final output.

Open Software Foundation (OSF)

A nonprofit research and development organization created by a consortium of companies that work together to develop software in the open systems market.

OpenType font (OTF)

An extension of the TrueType font format that adds:

- Support for PostScript outlines
- Better support for international character sets
- Broader support for advanced typographic control

open window

In the InfoPrint GUI, the action used to open a new application window representing one or more objects displayed in the currently open application window.

operation

An action performed on one or more data items.

operator

In InfoPrint, the person responsible for printer devices. Also, this person performs a subset of tasks for InfoPrint queues and actual destinations and performs some job-related tasks.

OPI

Open Prepress Interface.

optical character recognition (OCR)

Conversion of scanned text to editable ASCII characters.

option

A modifier of a command that specifies the action of the command. A dash usually precedes an option. Synonymous with *flag*. See also *keyword*.

orphan logical destination

In the InfoPrint GUI, an object that represents a logical destination that is not associated with an existing queue.

orphan logical printer

In the InfoPrint GUI, an object that represents a logical printer that is not associated with an existing queue.

OSF

Open Software Foundation.

overlay

A collection of constant data, such as lines, shading, text, boxes, or logos, that is electronically composed in the host processor and stored in a library, and that can be merged with variable data during printing.

OTF

OpenType font.

P

PAC

Privilege Attribute Certificate.

page definition

A resource that contains the formatting controls for line data.

In InfoPrint, a resource that defines the rules of transforming line data into composed pages and text controls.

page segment

A resource that contains composed text and images, which are prepared before formatting and included during printing.

Palladium

A distributed print system developed at MIT/Project Athena with participation from Digital Equipment Corporation (DEC), International Business Machines (IBM), and Hewlett-Packard (HP). It is a reference implementation for the OSI Document Printing Architecture (DPA) standard, ISO/IEC 10175.

pane

In the Work Area of the InfoPrint Manager Administration GUI, an area containing a group of objects of a specific type, such as an actual destinations pane.

parent/child relationship

In InfoPrint, servers, queues, and destinations are related to one another in a parent/child relationship. For example, a server is the parent of all the queues that reside in that server, and these queues are its children.

pass through

In InfoPrint, referring to options submitted with a job that are used by the device driver, but not InfoPrint. InfoPrint does not process or validate this information; it passes it along to the device driver. See *printer driver*.

path

The route used to locate files; the storage location of a file. A fully qualified path lists the drive identifier (if any), directory name, subdirectory name (if any), and file name with the associated extension.

pause

In InfoPrint, the action used to temporarily halt the printing or transmission of jobs on actual destinations or the distribution of jobs from servers or queues.

pdcreate

In InfoPrint, the command used to create a new object and set its attributes to specified values.

PDF

Portable Document Format.

Printer description file.

pdmsg

In InfoPrint, a utility used to display information about a message.

pdpr

In InfoPrint, the command used to create and submit a job, consisting of one or more documents, to a server for printing or transmission.

perfect binding

A type of book binding in which the pages are held together with flexible adhesive. Contrast with *edition binding*, *spiral binding*, and *wire-o binding*.

permissions

In AIX, codes that determine who can access a file and what operations they can perform on the file.

physical printer

In InfoPrint, a type of actual destination that represents a printer device. See also *printer device*.

piobe

The standard printer input/output backend program used by AIX for printing. See also *ainbe*.

pipe-pull

In InfoPrint, a document transfer method where InfoPrint saves the documents in a file and transfers the address of the file to the server. InfoPrint transfers the file to the server upon the request from the server. This is an efficient transfer method for large jobs and is the default transfer method at job submission. Contrast with *with-request*.

plex

A document or actual destination attribute used to define the placement of output images on the page. See the plex values *simplex* and *tumble*.

Portable Document Format (PDF)

An Adobe PostScript data format that can be viewed or printed.

Portable Operating System Interface for Computer Environments (POSIX)

An Institute of Electrical and Electronics Engineers (IEEE) standard for computer operating systems.

POSIX

Portable Operating System Interface for Computer Environments.

PostScript

Adobe's page description language. PostScript has become a standard for graphic design and layout software. PostScript files can contain both vector and raster data. Fonts are described using PostScript coding. Many desktop publishing systems produce PostScript data as their output data stream.

PostScript printer description (PPD)

A file that contains options for printing PostScript data on various printer devices.

PPD

PostScript printer description.

Prefix lengths

Identify a range of IPv6 addresses that are on the same network.

preflight

To assess all resources for a job before the actual print run.

prepress

Work done in the print shop before printing a job, such as preparing data and art, page imposition, color retouching, electronic editing, and page layout.

print database

The set of files on disk that provide a permanent repository for the attributes of all print objects, such as logical destinations, queues, and actual destinations.

print job

Synonym for *job*.

Print Quality Enhancement (PQE)

A printer facility that provides edge smoothing along diagonal lines, fine fidelity protection, and independent boldness control.

Print Services Facility (PSF)

Any of several programs, including PSF for AIX, PSF/MVS, PSF/VM, and PSF/VSE, that produce printer commands from the data sent to them.

print system

A group of one or more print servers and one or more printing devices, which might or might not be located in the same geographical area. The components of a print system are assumed to be interconnected in some manner, providing at least one network interface to print clients, and acting synergistically to supply the defined document print service. (D)

printable document

In InfoPrint, an object that represents text or data to be printed by a job. Contrast with *resource document*.

printer description file (PDF)

A file that contains options for printing PostScript data on a specific printer device.

printer device

The physical output device that performs the printing function. See also *physical printer*.

printer driver

A file that describes the physical characteristics of a printer or other peripheral device. This file is used to convert graphics and text into device-specific data at the time of printing or plotting.

Synonymous with *device driver*.

priority

In InfoPrint, a number assigned to a job that determines its precedence in being printed. Jobs with higher priority numbers are handled before jobs with lower priority numbers.

process color

Color made up of CMYK links simulating a specified color. This is the traditional method of reproducing continuous tone color images (color separations). Because of the nature of color inks, certain inks do not reproduce well.

processor

In a computer, a functional unit that interprets and executes instructions. A processor consists of at least an instruction control unit and an arithmetic and logic unit. (T)

promote

In InfoPrint, the action used to move a job to the beginning of the queue so that it will print on the next available printer that can handle that job.

protocol

A set of semantic and syntactic rules that determines the behavior of functional units in achieving communication.

pSeries

A family of workstations and servers based on IBM's POWER architecture. They are primarily designed for running multi-user numerical computing applications that use the AIX operating system.

PSF

Print Services Facility.

PSF destination support system

In InfoPrint, the destination support system that communicates with PSF for AIX to print jobs.

PSF physical printer

In InfoPrint, the object representing a printer device that uses the PSF destination support system.

Q**QuarkXpress**

A desktop publishing system produced by Quark, Incorporated.

queue

In InfoPrint, an object that manages a collection of jobs that are waiting to print. A queue receives jobs from one or more logical destinations and sends jobs to one or more actual destinations.

A line or list formed by items waiting for processing.

R

raster

A pattern of dots defined at varying data depths. Black and white images are one-bit (on/off); grayscale images are 8-bit (256 levels); RGB images are 24-bit; CMYK images are 32-bit.

raster image processor (RIP)

A processor in which a PostScript data stream is converted into dot patterns that are transferred to the final print medium. InfoPrint uses an Adobe RIP to convert PostScript to IPDS for such printers as the InfoPrint 4000 and InfoPrint 60.

rc.pd

In InfoPrint, a utility used to start the InfoPrint servers listed in the `/etc/pd.servers` file.

read-only

In InfoPrint, describes an attribute value that cannot be set by the user but can change based on other activity.

ready

A state in which an object is ready and able to perform tasks.

An available resource, such as a value of the `media-ready` attribute. Contrast with *supported*.

red, green, blue (RGB)

The colors of CRT display phosphors. RGB images are for screen display only. They must be converted to CMYK images before printing.

registration

The accuracy of printing on paper relative to the edges of the paper.

The accuracy of printing a single color (cyan, magenta, or yellow) relative to black.

The accuracy of printing on one side of a page relative to printing on the reverse side of the page.

reprographics

The process of copying or duplicating documents or information.

requested

In InfoPrint, pertaining to the specific values of attributes requested by a job when it is submitted. The requested attribute values of a job are validated against supported attribute values for an actual destination to determine if the printer can handle that job. Contrast with *supported*.

resettable attribute

An attribute whose value can be set or modified after an object has been created, assuming the object is in an appropriate state to be modified. See also *initially settable attribute*; contrast with *non-settable attribute*.

resource

In AFP, a file containing a collection of printing instructions used when printing a job. Resources include fonts, overlays, form definitions, page definitions, and page segments.

resource context

In InfoPrint, an object that contains directory path information that helps the print system locate resources needed for printing a job. The resources include fonts, overlays, form definitions, page definitions, and page segments.

resource document

In InfoPrint, an object that represents a resource, such as graphics or fonts, used by a job to print a printable document. Contrast with *printable document*.

resubmit

In InfoPrint, an action used to reroute pending or retained jobs to a different logical destination than the one through which the job was originally submitted.

resume

In InfoPrint, the action used to resume the printing of paused jobs or resume the distribution of jobs from paused servers or queues.

retained job

In InfoPrint, an object that represents a job that is being stored in the print system for a specified amount of time, normally after the completion of printing the job. A retained job does not reside in a queue.

retention

The process of storing data after completion of a process for a certain length of time.

retrieval

The process of bringing digital archived data out of storage and into online memory for reuse. See also *archiving*.

RGB

Red, green, blue.

RIP

Raster image processor.

To convert data to dot patterns using a raster image processor.

root user

In the AIX environment, the system user with the most authority who can log in and execute restricted commands, shut down the system, and edit or delete protected files. Synonymous with *superuser*.

RPC

Remote Procedure Call.

RPM

Red Hat Package Management is the baseline package format of the Linux Standard Base distribution.

S**scanner**

A device that converts hardcopy source data into digital format (halftone dots) to avoid retyping the data.

scheduler

In InfoPrint, the scheduling method that the queue uses when assigning a job to an actual destination.

separator sheet

The sheet of paper, blank or otherwise, that separates documents in a job. See also *auxiliary sheet*.

server

In InfoPrint, the object that accepts configuration, management, and printing requests, performs the requested operations, and sends responses back as a result of the operation.

settable attribute

See *initially settable attribute*, *resettable attribute*.

severity

An indication of how serious an error condition is.

shell

In the AIX operating system, a command interpreter that acts as an interface between the user and the operating system. In InfoPrint documentation, all shell examples use the Korn shell.

shift-out, shift-in code

Control characters used to indicate the beginning and end of a string of double-byte, ideographic characters.

shortest-job-first

In InfoPrint, a queuing technique where the next job assigned to the first position in the queue is the shortest job in the queue. Contrast with *deadline*, *FIFO (first-in-first-out)*, *job-priority*, and *longest-job-first*.

shut down

In InfoPrint, the action used to halt all server or actual destination processes without deleting the server or actual destination.

signature

A group of pages that are printed, folded, cut, and bound together. Manual placement of pages in the signature is determined using a folding dummy.

simplex

In InfoPrint, the value of the document or actual destination `plex` attribute indicating that output images are placed on the media in a head-to-head format, so that the top of one image is at the same edge as the top of the next image. Depending on the value of the document or actual destination `sides` attribute, the document can be printed on one or both sides of the paper. Contrast with *tumble*; see also *simplex printing* and *duplex printing*.

simplex printing

Printing on only one side of the paper. Contrast with *duplex printing (1)*.

Printing on one or both sides of the paper, placing output images on the media in a head-to-head format, so that the top of one image is at the same edge as the top of the next image. Contrast with *tumble duplex printing*; see also *duplex printing (2)*.

SMIT

System Management Interface Tool.

SNA

Systems Network Architecture.

spiral binding

A type of book binding in which wire or plastic coils are threaded through a series of holes or slots in the binding edge. Contrast with *edition binding*, *perfect binding*, and *wire-o binding*.

spot color

Individual colored inks formulated to exactly match a specified color. Spot color is used when CMYK process color cannot produce a reasonable facsimile of the color or when vivid color is needed. Spot color is also used when fluorescent or metallic colors are needed.

spread

In color printing, an area whose dimensions have been enlarged to eliminate white space between it and another color. Contrast with *choke*.

start sheet

The sheet of paper, blank or otherwise, that can precede a job. See also *auxiliary sheet*.

state

Synonym for *object state*.

stripping

The process of mechanically assembling film into plate layouts. Page imposition takes place during stripping.

subnet mask

Identify a range of IPv4 addresses that are on the same network.

subnetwork

Any group of nodes that have a set of common characteristics, such as the same network ID.

In the AIX operating system, one of a group of multiple logical divisions of another network, such as can be created by TCP/IP.

subtractive color system

A system that reproduces an image by mixing (adding) appropriate quantities of cyan, magenta, and yellow paints on white paper. These paints reflect certain colors and absorb—or subtract—others. Contrast with *additive color system*.

superuser

Synonym for *root user*.

supported

In InfoPrint, pertaining to the specific job attribute values that the actual destination can accept during job validation. InfoPrint validates the requested attribute values of the job against the supported attribute values of the actual destination to determine whether the actual destination can handle that job. Contrast with *requested*.

synchronous

Occurring with a regular or predictable time relationship to a specified action. Contrast with *asynchronous*.

system administrator

Synonym for *administrator*.

System Management Interface Tool (SMIT)

In the AIX operating system, an interface tool for installation, maintenance, configuration, and diagnostic tasks. SMIT lets you perform tasks without entering any commands.

Systems Network Architecture (SNA)

The description of IBM's logical structure, formats, protocols, and operational sequences for sending units through, and controlling the configuration and operation of, networks.

T

table reference character (TRC)

An optional control character in a print data set. The TRC identifies the font used to print the record and can be used to select a font during printing.

Tagged Image File Format (TIFF)

A digital format for storing scanned images. TIFF files are also referred to as raster format files (as opposed to vector format files). When used in desktop publishing, TIFF files produce only a low-resolution FPO image; the high-resolution data remains on the hard disk.

task help

A type of online help that provides a list of tasks that can be completed with a selected object. When you select a task, the help provides step-by-step information about how to complete the task.

TCP/IP

Transmission Control Protocol/Internet Protocol.

TCP/IP-attached printer

A printer device attached to an pSeries computer through telecommunication lines using the TCP/IP protocol.

In InfoPrint, a PSF physical printer that represents a TCP/IP-attached printer device. See also *AIX-attached printer*, *direct-attached printer*, and *upload-TCP/IP-attached printer*.

template

In the InfoPrint Manager Administration GUI, an object that represents a set of default attribute values that has been defined for creating a particular type of object, such as an actual destination.

ticket

See *job ticket*.

TIFF

Tagged Image File Format.

Transmission Control Protocol/Internet Protocol (TCP/IP)

A set of communication rules used in the Internet and in any network that follows the U.S. Department of Defense standards for inter-network protocol. TCP provides a reliable host-to-host protocol between hosts in packet-switched communications networks and in interconnected systems of such networks. It assumes that the Internet Protocol (IP) is the underlying protocol. See also *Internet Protocol*.

trapping

In desktop publishing, the amount of overlap in overprinting colors. Trapping prevents white paper showing through gaps caused by normal errors in registration. On sheet-fed presses, trapping is usually 0.25 point. See also *choke* and *spread*.

TRC

Table Reference Character.

TrueType font (TTF)

A font format based on scalable outline technology with flexible hinting. Glyph shapes are based on quadratic curves. The font is described with a set of tables contained in a TrueType Font File.

TTF

TrueType font.

tumble

In InfoPrint, the value of the document or actual destination **plex** attribute indicating that output images are placed on the media in a head-to-toe format, so that the top of one image is at the same edge as the bottom of the next image. The document must be printed on both sides of the paper. Contrast with *simplex*.

tumble duplex printing

Printing on both sides of the paper, placing output images on the media in a head-to-toe format, so that the top of one image is at the same edge as the bottom of the next image. Contrast with *simplex printing (2)*, *duplex printing (2)*.

U

UCR

Under color removal.

under color removal (UCR)

Conversion of neutral color areas to black ink that reduces use of CMY inks, improves trapping, and reduces setup time. Generally, UCR is performed during image scanning, but some RIPs perform it during processing. Synonymous with *gray component replacement (GCR)*.

unmanage

In the InfoPrint Manager Administration GUI, the action used to put an object into a mode where its icon does not reflect the changes of status for the object.

upload printer

See *upload-TCP/IP-attached printer*.

upload-TCP/IP-attached printer

In InfoPrint, a PSF physical printer that represents a printer device attached through an MVS system and managed by PSF/MVS. InfoPrint communicates with the MVS system through the TCP/IP network. See also *AIX-attached printer*, *direct-attached printer*, and *TCP/IP-attached printer*.

V

validate

In InfoPrint, to compare the attribute values requested by a job with the supported attribute values of the actual destinations in the system and to determine whether there is an actual destination capable of printing or sending the job.

value

A specific characteristic of an attribute.

variable

A name used to represent a data item whose value can change while the program is running.

variable data

Data that can be changed between copies of a document. For example, a form letter (constant data) can be merged with variable data, such as a customer's name and address to produce personalized documents.

varnish

A protective layer applied to a finished sheet, usually for photos, but sometimes used as a design element because of its reflective qualities. Varnishes can be tinted.

vector

An absolute coordinate point and line in space. PostScript files can contain vector artwork. Vector files are converted to rasters during the RIP process.

velox

A black and white photographic print made from a halftone negative, to be used as a proof copy.

vignette

An image with soft, fade-away edges.

Virtual Machine (VM)

An IBM licensed product that manages the resources of a single computer so that multiple computing systems appear to exist.

A virtual data processing system that appears to be at the exclusive disposal of a particular user, but whose functions are accomplished by sharing the resources of a real data processing system. (T)

Virtual Storage Extended (VSE)

An IBM licensed program whose full name is the Virtual Storage Extended/Advanced Function. It is a software operating system controlling the execution of programs.

Visual Systems Management (VSM)

In AIX, a type of graphical user interface that allows system management through the direct manipulation of objects.

VM

Virtual Machine.

VSE

Virtual Storage Extended.

VSM

Visual Systems Management.

W**web**

A roll of paper used in web or rotary printing.

well

In the InfoPrint Manager Administration GUI, an area in a pane that contains a group of objects related to the objects in the pane; for example, a queues well in a servers pane.

what you see is what you get (WYSIWYG)

Refers to the fact that the composite image displayed on the screen at a computer workstation has the appearance of the final printed image.

window

A rectangular area of the screen that you can move about, place on top of, or pull under other windows, or reduce to an icon.

wire-o binding

A continuous double series of wire loops run through punched slots along the binding side of a booklet. Contrast with *edition binding*, *perfect binding*, and *spiral binding*.

with-request

In InfoPrint, a document transfer method where the client transfers the documents directly to the server. Contrast with *pipe-pull*.

workstation

A terminal or microcomputer, usually one that is connected to a mainframe or to a network, at which a user can use applications.

write access

A level of authorization that grants the ability to modify data.

WYSIWYG

What you see is what you get.

X**X-Windows**

A network-transparent windowing system developed by MIT. It is the basis for Enhanced X-Windows, which runs on the AIX Operating System.

xerography

A dry printing process using corona-charged photoconductive surfaces to hold latent images that are developed with a dry toner and then transferred to paper and fused with heat.

Xstation

A terminal that is connected through a network to an pSeries computer, from which a user can perform command-line functions and run X-Windows based applications.
